Introduction

The General Data Mart, which resides in the HOLLYWD database, is essentially a mirror of the NDW production warehouse. Comprised of a set of views, MQTs, and/or tables of the HOLLYWD database, this data mart provides access to the following data:

- Complete set of all current registration data records including user population data
- Complete set of all current encounter data records including historic encounter records
- Complete set of reference table data records
- Meta data, which contains information about tables and columns included in the database
- A snapshot of Historic Legacy data tables (not updated)
- Administration tables
- Modified set of registration data that has been partially cleansed of Personally Identifiable Information (PII).

Note: Table Type = T(able), V(iew), N(ickname)
