Preface

The purpose of this manual is to provide technical information about the Indian Health Service (IHS) Standard Terminology (BSTS) package, specifically changes introduced in Patch 3 of the Version 1.0 release. The BSTS package contains a number of Application Programming Interface (API) calls developed to interface with Apelon’s Distributed Terminology System (DTS). These APIs provide a general interface and caching mechanism for MUMPS-based/FileMan-based systems to interact with an external terminology server, specifically DTS.

DTS 4.2, provided by Apelon is a comprehensive open source solution for the acquisition, management and practical deployment of standardized terminologies, with local enhancements, into distributed application environments. DTS establishes a single common resource for an organization’s terminology assets that can be deployed across the spectrum of health information delivery systems.
1.0 Introduction

The BSTS package is a component of the IHS Resource and Patient Management System (RPMS) that provides a general interface and caching mechanism for MUMPS-based/ FileMan-based systems to interact with an external terminology server, specifically DTS. The APIs are designed to be application independent, and stand-alone interfaces.

This manual provides IHS site managers with a technical description of the BSTS APIs, routines, files, menus, cross references, globals, and other necessary information required to effectively utilize the APIs from an external application to access Systematized Nomenclature of Medicine-Clinical Terms (SNOMED CT®), RxNorm, Unique Ingredient Identifier (UNII) codesets as well as IHS defined custom mapping codesets located in an external terminology service. The APIs also have the flexibility to retrieve other terminologies from DTS in the future, such as, International Classification of Diseases (ICD) Codes.

All APIs, routines, files, options, and keys are namespaced starting with the letters BSTS. The file number range for this package is 9002318–9002318.99.
2.0 Orientation

The BSTS package consists of a set of APIs to be called from an external application to search and return valid terminology concepts and associated information. The API package is distributed as a Kernel Installation and Distribution System (KIDS) package which contains the appropriate files and routines to enable data storage, auditing/logging, performance metrics and tools for monitoring and analysis, and a formal error handling and reporting mechanism.

Interaction between the external application (e.g., IHS Electronic Health Record (EHR), iCare) and the DTS is accomplished through the BSTSs via web service calls or requests. All APIs in this package begin with the namespace letters BSTS.

A high-level diagram of the terminology services architecture is shown in Figure 2-1. Each of the main components identified is detailed in the sections that follow.

---

Figure 2-1: High-level Application Architecture Diagram for the IHS Terminology Services Solution
2.1 RPMS Applications

Pictured on the left-hand portion of Figure 2-1 are the various RPMS applications that interact with the terminology systems. Several development modalities exist for these RPMS applications, including those created using Microsoft® .NET Framework, components with the IHS EHR, as well as the traditional character based green screen applications.

Each of these types of applications connects to RPMS in different ways.

- The Microsoft .NET applications utilize an ADO.NET adapter for RPMS that is called BMXNet.
- The EHR components utilize a Remote Procedure Call (RPC) broker mechanism referred to as the “CIA Broker”.
- The character-based applications are executed directly within the RPMS InterSystems Caché® database and therefore have direct access to the RPMS database.

In the proposed solution, each of these types of applications would continue to interact with RPMS using the same mechanisms they currently utilize and would interact with the terminology services via the new RPMS Terminology Services API that is described within this document.

2.2 Terminology Service RPMS API

For the initial set of SNOMED CT related use cases, applications will interact with a new MUMPS-based API that exposes functions and classes that encapsulate the interface with the DTS terminology server. This API will return information in familiar data array format and will eliminate the need for the applications to directly interface with the web service interface and related XML messaging.

While this RPMS API is expected to be the primary means through which RPMS-based applications will interact with the terminology server functions, there may be valid use-cases that arise in the future that would be best accommodated through direct web-service interaction with the terminology service. There is nothing that would preclude this direct access by applications in the future.

The majority of this technical manual is focused on describing the current implementation of this terminology API.

2.3 Stand-alone Terminology Service Instance

The terminology service solution component selected for this proposed design is the DTS Version 4.2 created by Apelon. Specific information about the DTS 4.2 application follows:

Additiona design information for the terminology service architecture to support utilization of terminologies such as SNOMED CT is documented in the document titled “IHS Terminology Services – High-level Technical Design Version 1.5”.
3.0 Implementation and Maintenance

The BSTS APIs are designed to provide a MUMPS-based programming interface for RPMS development teams to work with terminology data. The API in turn utilizes a web service interface to interact with the terminology servers, with the initial implementation being an interface with the Apelon DTS 4.2 terminology service.

RPMS menus in the BSTS system:

IHS Standard Terminology Management [BSTSMENU]. This menu option requires key BSTSZMENU and contains the following five options for managing BSTS:

- **Add/Edit Terminology Web Service** [BSTS WEB SERVICE]. Updates information about web services used by the site. This option requires the BSTSZMENU security key.
- **Edit Terminology Site Parameters** [BSTS EDIT SITE PARAMETERS]. Updates site specific configuration settings. This option requires the BSTSZMENU security key.
- **Terminology Web Service Test** [BSTS TEST WEB SERVICE]. Performs a test call to a web service. This option requires the BSTSZMENU security key.
- **Refresh IHS Standard Terminology Local Cache** [BSTS REFRESH LOCAL CACHE]. This option allows users to refresh the SNOMED with US Extentions codeset subsets or lets users select a custom mapping codeset and refresh its values.
- **Check Terminology Web Service Status** [BSTS CHECK WEB SERVICE]. This option is a utility which allows site managers to monitor and control the DTS interface link.

4.1 Menu Option Descriptions

4.1.1 Add/Edit Terminology Web Service
Site Managers will use this option to enter the connection properties for the server (or servers) that their site will utilize to retrieve codeset information. With the release of BSTS v1.0 Patch 2, the values needed for the site to connect to the IHS DTS PRODUCTION server are listed below. Patch 3 does not change these settings:

Select IHS Standard Terminology Management Option: WEB Add/Edit Terminology Web Service
Select BSTS WEB SERVICE ENDPOINT NAME: PRODUCTION SERVER
URL ROOT: https://dtsservices.ihs.gov Replace
PORT NUMBER: 42102/
TYPE: DTS4/
TIMEOUT OVERRIDE: 60/
CONNECTION TIMEOUT OVERRIDE:
USERNAME: DTSUser//
PASSWORD: DTSPW!//
SERVICE PATH: /soap/
SSL/TLS CONFIGURATION: SNOMEDServer//
CHECK FOR DTS CONNECTION ON:
CHECK FOR CONNECTION AFTER:
MAXIMUM REMOTE SEARCH TIME:

Some of the properties listed above are site adjustable. They can be modified to account for network issues and site preferences. These properties are explained as follows:

**TIMEOUT OVERRIDE** – This is a maximum time a DTS web service call will wait for a query to finish before it quits (if null, the default is 60 seconds). If a DTS call exceeds this value, the BSTS application will switch over to local access mode. Note that this property pertains to all calls to DTS. Many of these calls happen in the background and are not apparent to the user. Care should be taken to set this property to a value less than 60 seconds. To control DTS maximum DTS search times, please adjust the MAXIMUM REMOTE SEARCH TIME property instead of this property.

**CONNECTION TIMEOUT OVERRIDE** – This is the maximum time a DTS web service call will wait for a connection to be established to the DTS server (if null, the default is 2 seconds). Sites with slower network connections may need to adjust this setting to a higher value. Every attempt should be taken however to keep this value as low as possible to avoid longer waits during SNOMED concept lookups. If the time to establish a connection with the DTS server exceeds this value, the BSTS application will switch over to local access mode.

**CHECK FOR DTS CONNECTION ON** – When the DTS server is operating in local access mode this property will contain a date and time in the future. This is the date and time after which the application will attempt to contact the DTS server again to see if it is online. If the value of this property is null, the connection to the DTS server is operating successfully.

**MAXIMUM REMOTE SEARCH TIME** - If after a search call to DTS is completed it is determined that, even though the call was successful, it still took longer to complete than the number of seconds listed in this field, it will switch the server of to local access mode. This value should be less than or equal to the TIMEOUT OVERRIDE value.
CHECK FOR CONNECTION AFTER – When the DTS server switches to local access mode, it will remain in local access mode until the number of minutes specified in this property are reached. When that wait period has been reached the next call made to DTS after that will attempt to restore connection to the server. If the server is back online or search calls are now returning within the allowable MAXIMUM REMOTE SEARCH TIME, the DTS link will be switched back on.

4.1.2 Edit Terminology Site Parameters

This option is used during the initial installation of the BSTS version 1.0 application (please refer to the BSTS version 1.0 Installation Manual for further details). The only property that may ever need to be adjusted after the initial installation is the REFRESH SUBSETS EVERY # DAYS property which is documented below. Figure 4-1 shows a typical entry in the BSTS SITE PARAMETERS file.

Figure 4-1: Sample BSTS SITE PARAMETERS file entry

REFRESH SUBSETS EVERY # DAYS – This property controls how often to automatically refresh subsets at the site. Since this is a system intensive process care should be taken to not perform refreshes too often. The default value for this property is 60 days.

4.1.3 Terminology Web Service Test

This option allow users to test the DTS server to see if it is properly returning results. The option is documented in the BSTS version 1.0 Installation Manual.

4.1.4 Refresh IHS Standard Terminology Local Cache

With the release of BSTS v1.0 Patch 3, sites now have the ability to manually retrieve content updates made available for download. Sites can run this option to immediately get these content updates. This option kicks off a background task which will refresh the desired content. Depending on the selection, the process could take several hours to complete. Only one background process can be running at a time. Figure 4-2 shows a sample process being kicked off.
minology Local Cache

This option allows sites to manually refresh IHS Standard Terminology (BSTS) information cached locally at the site. Using this option, the subsets associated with the 'SNOMED with US Extensions' codeset can be refreshed with up to date information retrieved from the Apelon DTS server. This option also allows custom codeset mappings to be refreshed with current mappings available through DTS.

Are you sure you want to do this? NO// YES

4.1.5 Check Terminology Web Service Status

This option allows site managers to quickly determine the status of the DTS connection, to turn the link On/Off and to adjust the setup properties for the connection. Figure 4-3 shows a sample display of this option.

Select IHS Standard Terminology Management Option: STS Check Terminology Web Service Status

Select BSTS WEB SERVICE ENDPOINT NAME: PRODUCTION SERVER

Current Server Status:
Web Service: PRODUCTION SERVER
Current Status: ONLINE
Offline Until: N/A
Last Error Message: N/A

Current Server Settings:
CHECK FOR CONNECTION AFTER: 60 minutes (default)
CONNECTION TIMEOUT OVERRIDE: 2 seconds (default)
MAXIMUM REMOTE SEARCH TIME: 60 seconds (default)
TIMEOUT OVERRIDE: 60 seconds

Choose from the following options
1. Refresh Current information
2. Check DTS and Enable if Available
3. Turn off the DTS Link
4. Edit Server Settings
When running the option, the user will be prompted to enter the web service to monitor. Most sites will only have one web service (PRODUCTION or PRODUCTION SERVER) set up. After selecting the appropriate server, the user will be presented with a display similar to Figure 4-3. The user then has the following four options to choose from:

- **Refresh Current information** – Running this option will refresh the current screen. It will not attempt to check to see if the DTS server is now available. It is possible that the screen display might change by running this option if the DTS server status became enabled/disabled by another process attempting to perform a call to DTS.

- **Check DTS and Enable if Available** – This option will attempt to contact the DTS server. If the call is successful, it will place the server back online. If the call is not successful, it will update the Offline Until value to be the current date/time plus the number of minutes specified by the **CHECK FOR CONNECTION AFTER** property documented above.

- **Turn off the DTS Link** – Running this option will manually turn off the link to DTS for the specified amount of time.

- **Edit Server Settings** – This option will allow the setup properties specified earlier to be adjusted.

9.0 Archiving and Purging

There is no archiving or purging in BSTS.
10.0 Documentation Resources

This section describes a few methods to generate BSTS technical documentation.

10.1 %INDEX Option

This option analyzes the structure of a routine to determine in part if the routine adheres to RPMS programming standards. The %INDEX output can include the following components:

- Compiled list of errors and warnings
- Routine listing
- Local variables
- Global variables
- Naked globals
- Label references
- External references

Running %INDEX for a specified set of routines allows users to discover any deviations from RPMS programming standards that exist in the selected routines and to see how routines interact with one another (i.e., which routines call or are called by other routines).

To run %INDEX for the Patient Registration package, type the BSTS namespace at the “Routine(s)?>” prompt.

10.2 List File Attributes Option

This VA FileMan option allows users to generate documentation pertaining to files and file structure. Using the standard format of this option yields the following data dictionary information for a specified file:

- File name and description
- Identifiers
- Cross-references
- Files pointed to by the file specified
- Files that point to the file specified
- Input, print, and sort templates

In addition, the following applicable data is supplied for each field in the file:

- Field name, number, title, and description
• Global location
• “Help” prompt
• Cross-references
• Input transform
• Date last edited
• Notes

Using the Global Map format of this option generates an output that lists the following information:

• All cross-references for the file selected
• Global location of each field in the file
• Input, print, and sort templates
11.0 SAC Requirements and Exemptions

No Standards and Conventions (SAC) exemptions are noted at this time, although we may need to pursue an exemption for the use of some Caché classes within the BSTSCMCL routine.
12.0 Templates, Forms, and Protocols

12.1 Print Templates
There are no print templates in BSTS.

12.2 Sort Templates
There are no sort templates in BSTS.

12.3 Input Templates
- BSTS ADD/EDIT WEB SERVICE
- BSTS EDIT SITE PARAMETERS

12.4 List Templates
There are no list templates in BSTS.

12.5 Forms
There are no forms in BSTS.

12.6 Protocols
There are no protocols in BSTS.
13.0 SNOMED CT Search API

13.1 Description of Development Environment

The SNOMED CT Search API was developed using the programming language C# within Microsoft Visual Studio® 2012 integrated development environment. SNOMED CT Search API is written to utilize the .NET 2.0 Framework. All new classes created for the SNOMED CT Search API exist within the namespace IndianHealthService.SNOMEDCTSearch.

In addition to the standard .NET object classes, the SNOMED CT Search API also uses commercially available Windows form controls from Infragistics. All the controls used were part of a package of controls named Infragistics NetAdvantage® for Windows Forms 2010 Volume 3.

In addition, the SNOMED CT Search API also utilizes the BMX version 4.0 software to facilitate data retrieval and updates are handled through the RPCs defined in the BSTSRPC and BMXRPC namespaces.

All of the dynamic link library (dll) files upon which SNOMED CT Search API depend are delivered with the SNOMED CT Search API install package and are stored in the directory specified by the user (default install directory is: C:\GDIT\SNOMED CT Search API).

13.2 SNOMED CT Search API RPMS Server Requirements

The RPMS server portion of the iCare application does not require a specific version of Caché or OS. However, the server needs to be able to support BMX 4.0 fully, and is therefore subject to any requirements needed to run that application. Please refer to the BMX version 4.0 Technical Manual for details.

13.3 List of SNOMED CT Search API Dependencies

The following table shows the graphical user interface dependencies associated with the SNOMED CT Search API application.

In this case, it is looking up the SNOMED CT information for a given IHS Med Route entry (utilizing a local cache lookup):

Glossary

Electronic Health Record
An application used by medical organizations to track patient medical records and care.

ICD Codes
One of several code sets used by the healthcare industry to standardize data. The International Classification of Disease (ICD) codes are an international diagnostic coding scheme. In addition to diseases, ICD also includes several families of terms for medical-specialty diagnoses, health status, disablements, procedures, and reasons for contact with HCPs. IHS currently uses ICD-9 for coding.

Office of Information Technology
The organization within IHS that is responsible for developing and maintaining RPMS and related IT functions.

Resource and Patient Management System
A series of integrated software components that includes clinical, administrative, and financial functions.
