INTRODUCTION

The 2019 California Area Report contains detailed performance results for all clinical Government Performance Results Act (GPRA) and Government Performance and Results Modernization Act (GPRAMA) measures collected from 38 (30 tribal and 8 urban) California programs. In FY 2019, 36 California programs (29 tribal, 7 urban) reported results via the Integrated Data Collection System (IDCS) Data Mart at the National Data Warehouse (NDW).

FY 2019 was the second year for reporting GPRA/GPRAMA data through the NDW. Data is received at the NDW via monthly, quarterly, or annual data exports sent by each health program, regardless of which Electronic Health Record (EHR) software is being used. Prior to FY 2018, GPRA/GPRAMA data was reported via the Clinical Reporting System (CRS) software package in RPMS and only health programs utilizing RPMS could have their data included in national and Area GPRA reports. In addition, the 12-month GPRA reporting period also changed in FY 2018, from July 1 through June 30 to October 1 through September 30.

With the change to reporting GPRA/GPRAMA via IDCS, the denominators for the measures changed from Active Clinical Population, which required two visits in the last three years, to User Population, which requires one visit in the last three years. As a result, denominators are much larger and overall results have declined significantly. The FY 2018 and 2019 targets were much lower in anticipation of the decreased results and larger denominators.

The California Area Report includes detailed results for 26 clinical GPRA/GPRAMA measures reported by Tribal and Urban programs in FY 2019. Measure results are displayed in two graphs. The first graph displays California Area aggregate tribal results for FY 2019 and FY 2018, as well as the FY 2019 IHS national average. The second graph displays results for each reporting California Indian health program for FY 2019. The table under each graph shows the percentage of patients that met each measure in FY 2019.

Health programs should use the data in this report to review current year results from IDCS with previous year's results, compare with other California programs and with national averages, and assess their progress toward achieving long-term goals. Page five of this document displays a 2019 GPRA User Population table for all reporting California Indian health programs so programs can compare their progress with other programs of similar size.

In FY 2019, California tribal and urban programs met 12 of the 26 clinical measures. Two of these measures had a baseline target, as one was a new measure in 2019 and one had a significant logic change. California Area tribal and urban programs exceeded the IHS national average on 6 of 26 measures and improved over FY 2018 results on 12 of 24 comparable measures.

GPRA MEASURES

Results

California Area Trends (2018-2019)

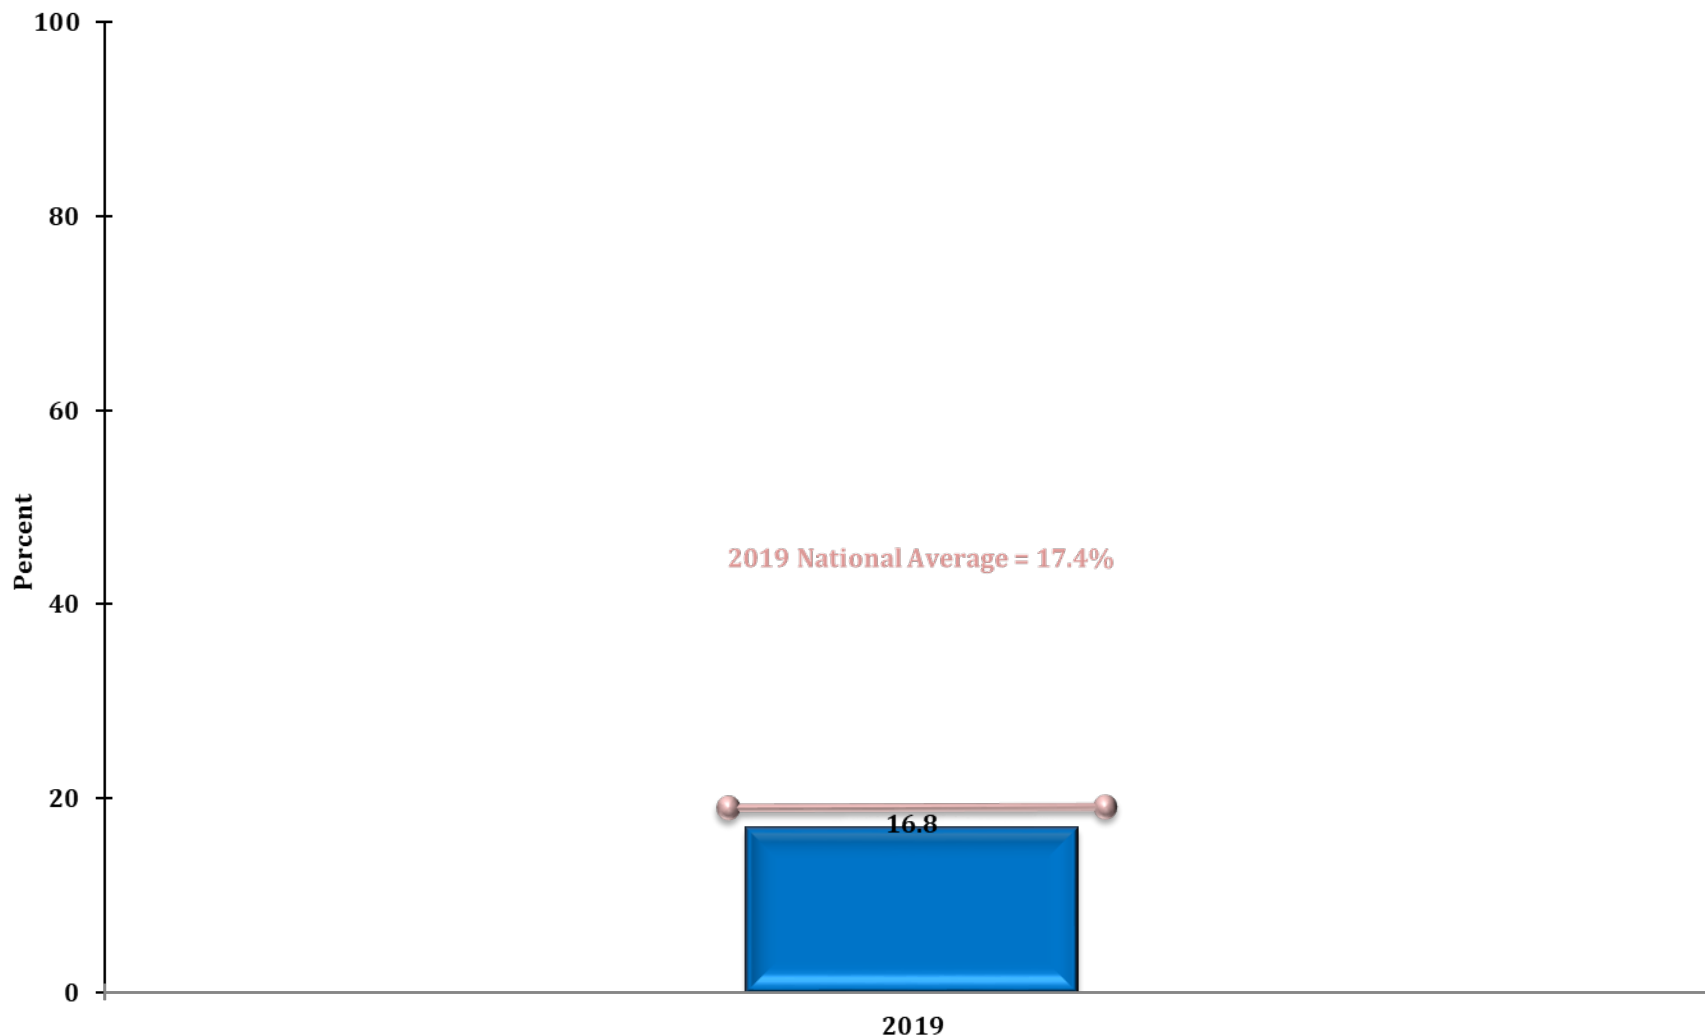

and

Results by Program (2019)

DIABETES: POOR GLYCEMIC CONTROL

Measure: Percentage of patients with diagnosed diabetes with poor glycemic control (A1c>9.0).

Importance: *Keeping blood sugar levels under 8 can slow or prevent the onset and progression of many health conditions and complications caused by diabetes. Clinical studies have shown that keeping glycemic levels in the “good” range (below 8) results in a significantly reduced risk of eye disease, kidney disease, nerve disease, heart attack, and stroke.*

*New measure in FY 2019

DIABETES: POOR GLYCEMIC CONTROL

DIABETES: BLOOD PRESSURE CONTROL

Measure: Percentage of patients with diagnosed diabetes that have achieved blood pressure control (BP < 140/90).

Importance: *Good blood pressure control can reduce the risk of complications from diabetes. A large clinical study found that diabetics with blood pressure kept under control had a significantly reduced risk of death, heart attack and stroke.*

DIABETES: BLOOD PRESSURE CONTROL

DIABETES: STATIN THERAPY

Measure: Percentage of patients with diagnosed diabetes who are 40 to 75 years old or 21 years of age and older who also have CVD or high cholesterol, who receive statin therapy.

Importance: *Research has shown that diabetic individuals are at higher risk for strokes and heart attacks. Having CVD or high LDL cholesterol levels increases the risk of a stroke or heart attack even more. Studies have shown that diabetic patients receiving statin therapy had a 22% reduction in the rate of cardiovascular events. The American Diabetes Association standards of care state that statin treatment should be given to diabetic individuals who have CVD risk factors.*

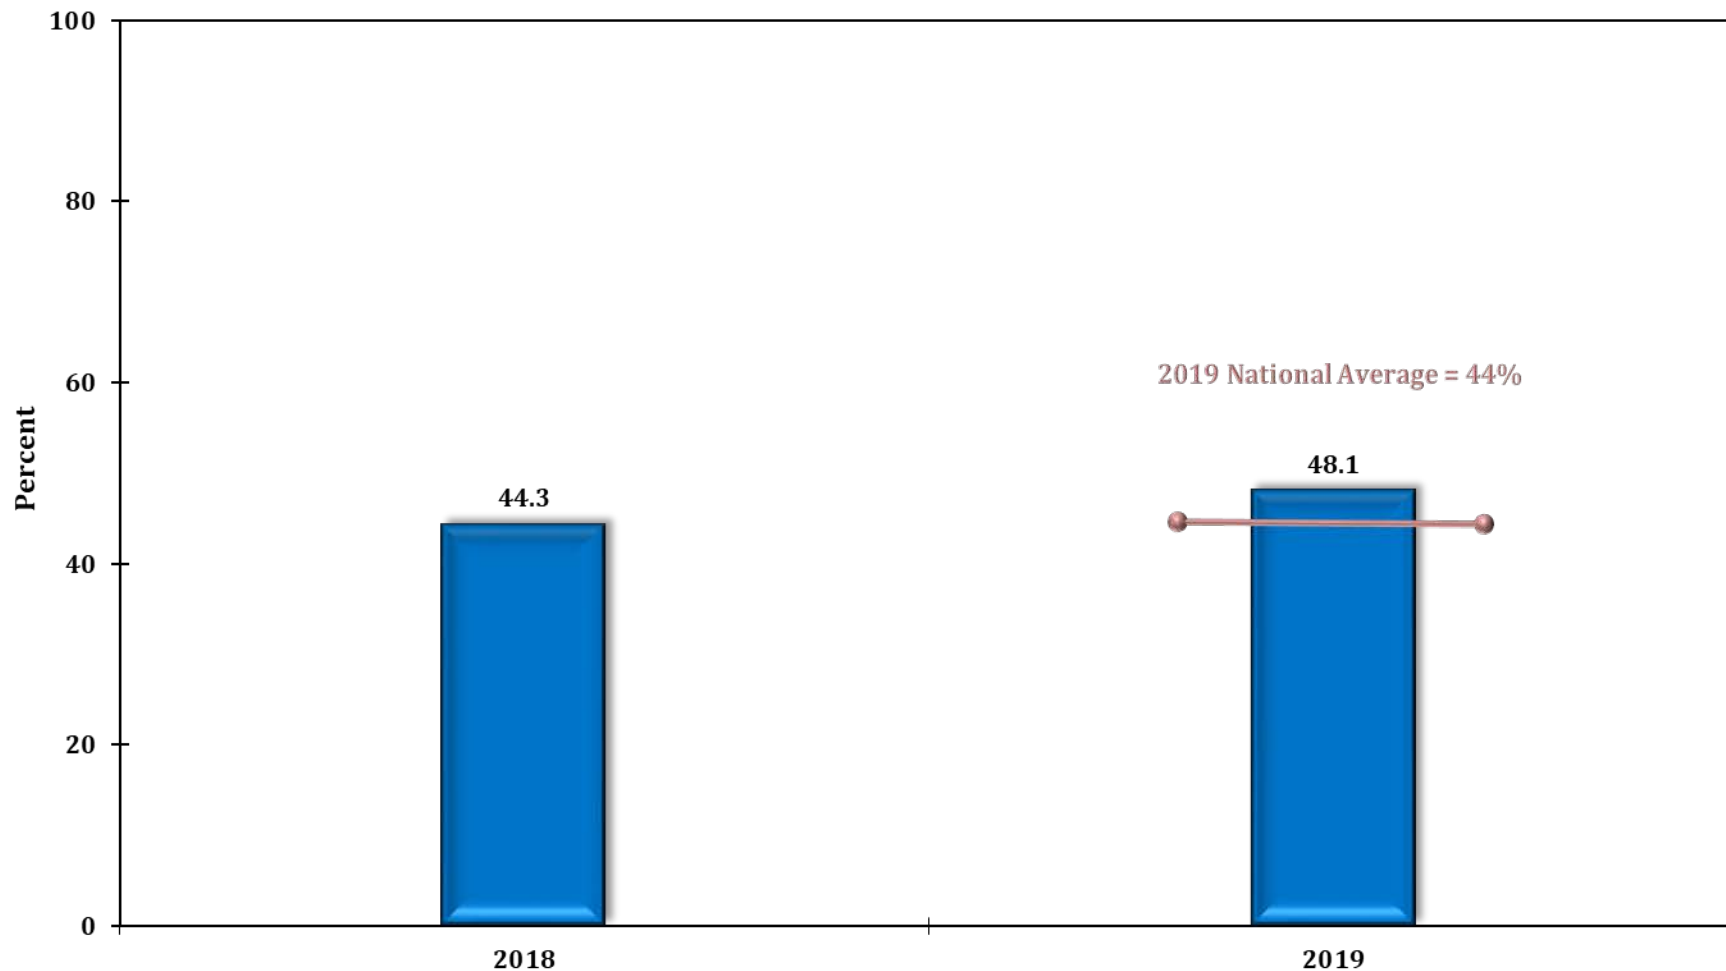

DIABETES: STATIN THERAPY

DIABETES: NEPHROPATHY ASSESSMENT

Measure: Percentage of patients with diagnosed diabetes assessed for nephropathy.

Importance: *Diabetes can cause kidney disease by damaging the parts of the kidneys that filter out wastes. Diabetic nephropathy, or kidney disease, can eventually lead to kidney failure. Diabetes is the leading cause of end stage renal disease (ESRD), which is a significant and growing problem in American Indian communities. Early identification of at-risk patients may help prevent or delay the need for costly care such as dialysis or transplants.*

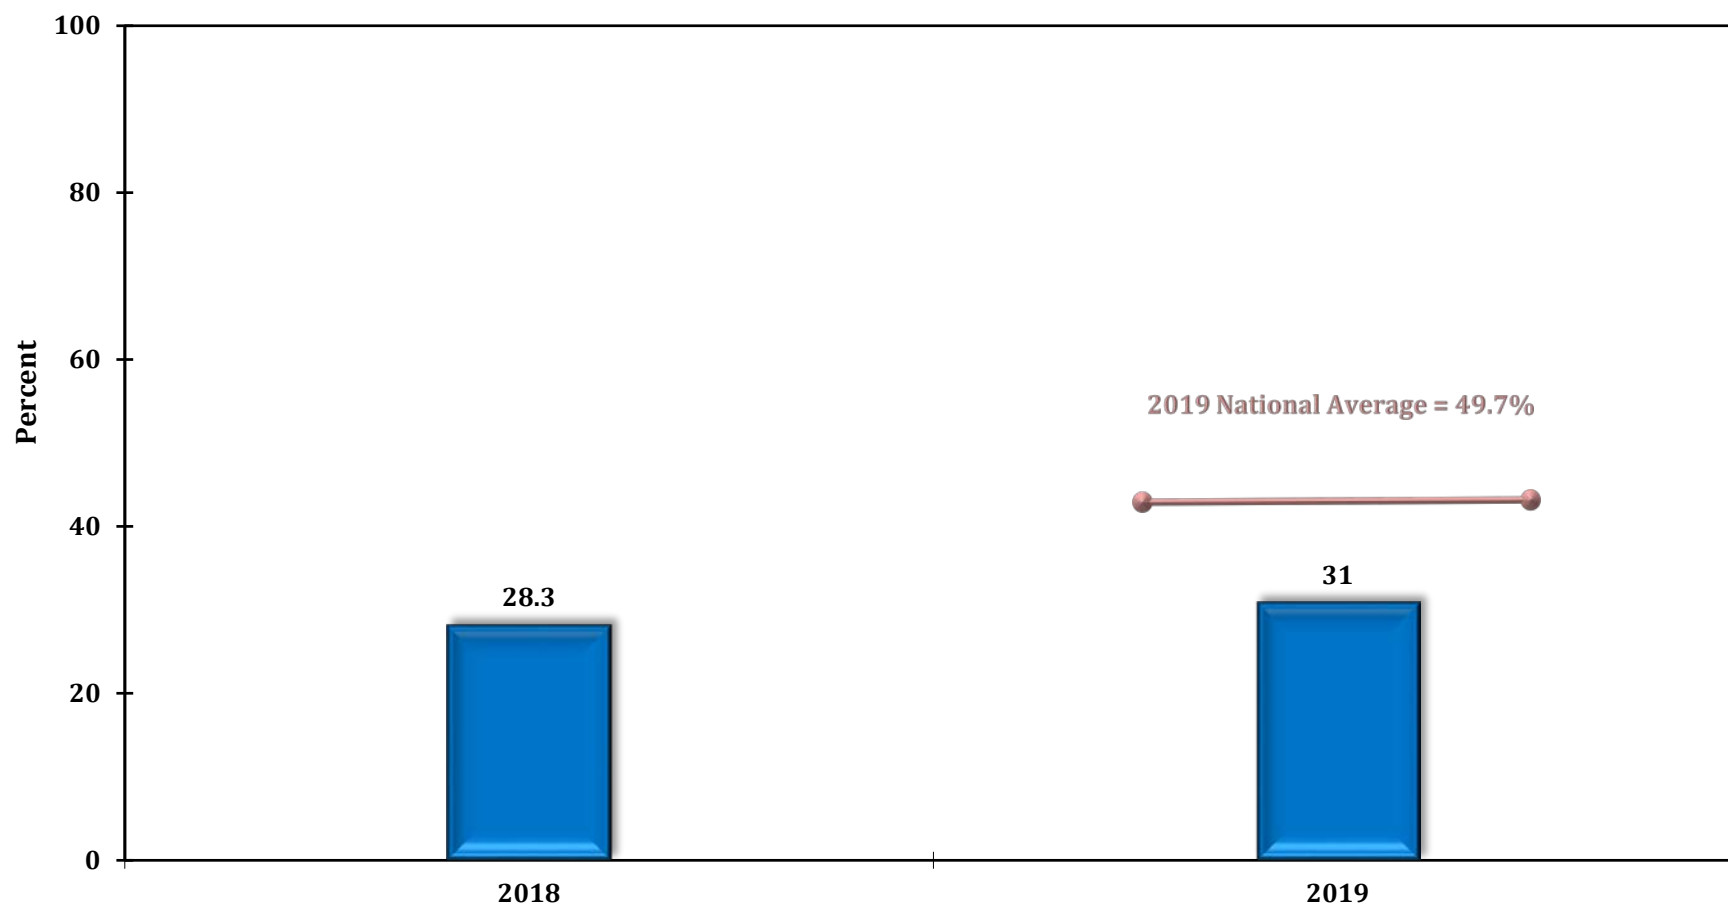

DIABETES: NEPHROPATHY ASSESSMENT

DIABETES: RETINOPATHY

Measure: Percentage of patients with diagnosed diabetes who receive an annual diabetic retinal examination.

Importance: *Diabetes can affect sight by damaging the blood vessels inside the eye, a condition known as “diabetic retinopathy.” Diabetic eye disease is a leading cause of blindness in the United States. Early detection of diabetic retinopathy (DR) helps to reduce vision problems in diabetic patients. A treatment known as “laser photocoagulation” can be effective, but only if the problem is identified early.*

DIABETES: RETINOPATHY

DENTAL: GENERAL ACCESS

Measure: Percentage of patients who obtain access to dental services.

Importance: *American Indians and Alaska Natives are less likely to receive regular dental care compared to non-Hispanic whites. Untreated tooth decay can cause many complications, including abscesses, infections, and pain, and can lead to other health problems. Access to dental care improves the oral health as well as the overall health of AI/AN people.*

DENTAL: GENERAL ACCESS

DENTAL: SEALANTS

Measure: Percentage of AI/AN patients ages 2 to 15 years who have intact sealants

Importance: *American Indian and Alaska Native children have significantly higher dental decay rates than the general U.S. population. Dental sealants are an effective way to reduce decay and can be applied for a relatively low cost. Sealants can provide 100% protection from dental decay, and can prevent decay from continuing once it has started.*

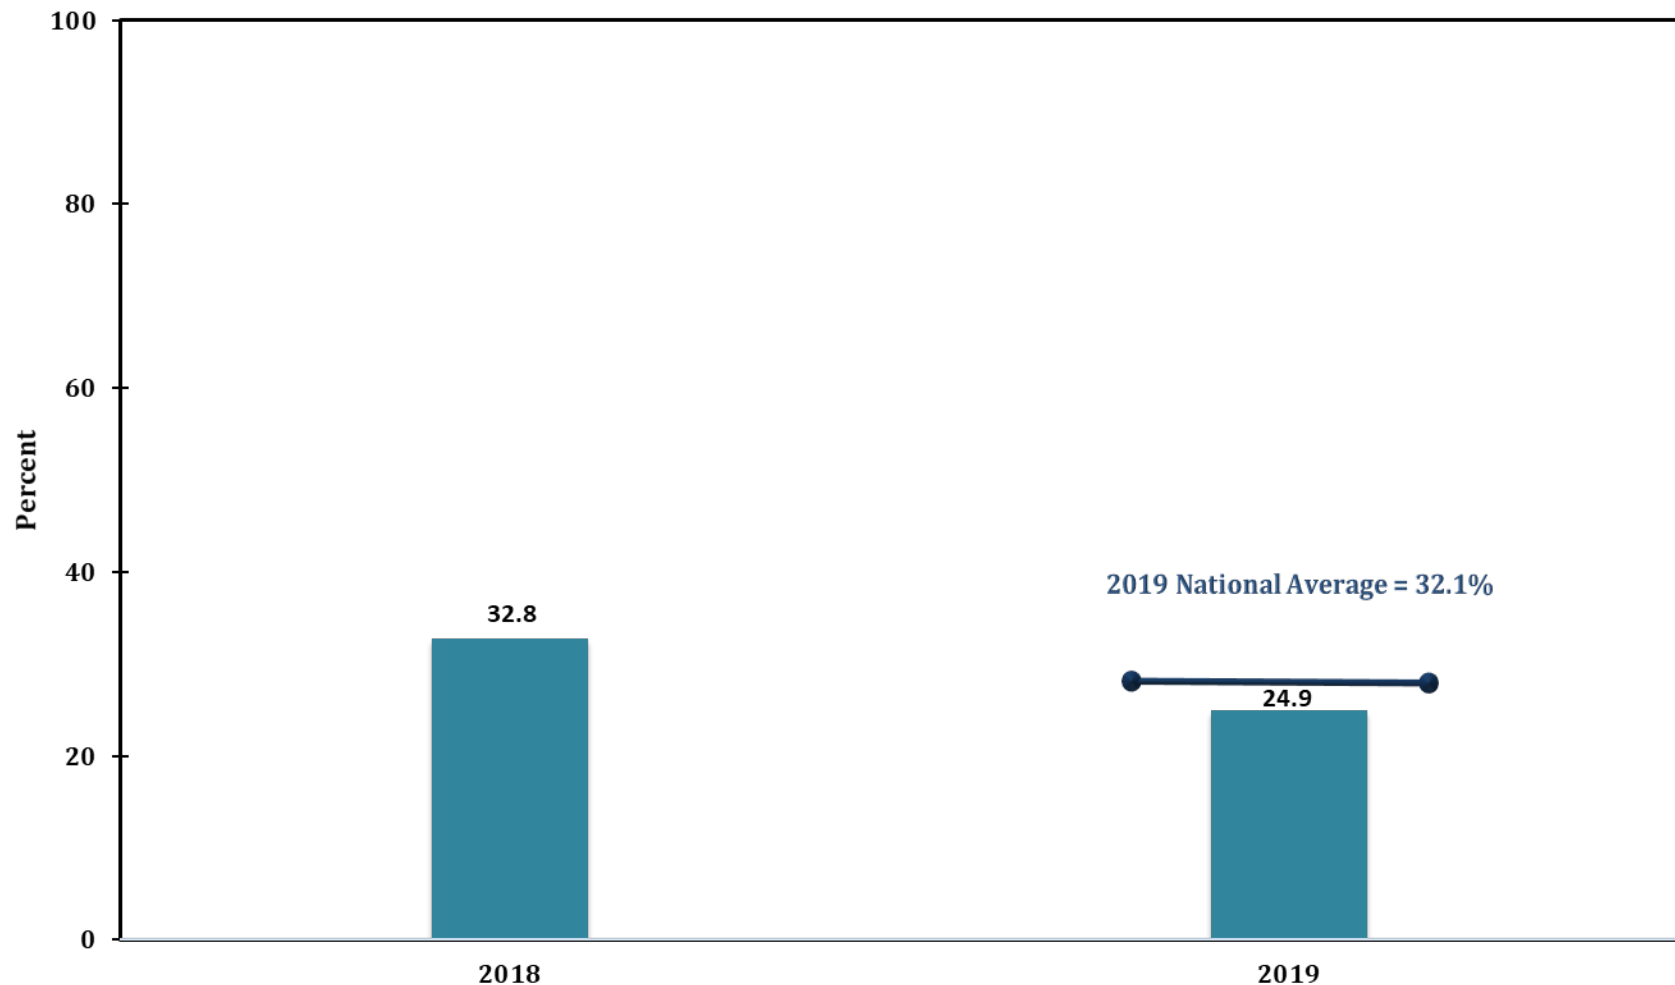

DENTAL: SEALANTS

DENTAL: TOPICAL FLUORIDES

Measure: Percentage of AI/AN patients ages 1 to 15 years with one or more topical fluoride treatments during the report period

Importance: *The topical application of fluoride helps prevent cavities and is appropriate for children, adolescents, and adults. Patients who receive at least one fluoride application have fewer new cavities, which reduces the cost of providing dental care, and improves the oral health of patients.*

DENTAL: TOPICAL FLUORIDES

IMMUNIZATIONS: INFLUENZA 6 MONTHS – 17 YEARS

Measure: Influenza vaccination rates among pediatric patients ages 6 months to 17 years.

Importance: *Influenza (the “Flu”) is a highly contagious respiratory illness that can cause life-threatening complications. Children, especially those aged 6 months to 5 years, are at a much higher risk of serious flu complications due to their young age. The CDC recommends all children ages 6 months to 17 years get vaccinated for flu each year. Annual flu vaccination is the most effective way to protect children from the flu and its associated complications.*

IMMUNIZATIONS: INFLUENZA 6 MONTHS – 17 YEARS

IMMUNIZATIONS: INFLUENZA 18+

Measure: Influenza vaccination rates among adult patients ages 18 years and older.

Importance: *Influenza (the “Flu”) is a highly contagious respiratory illness that can cause life-threatening complications. American Indians and Alaska Natives are at higher risk from flu complications and are more likely to be hospitalized due to flu. Studies have shown that people who get a flu vaccine have fewer flu illnesses and doctor’s visits due to flu symptoms. They are also less likely to spread the flu to family, friends, and others in the community.*

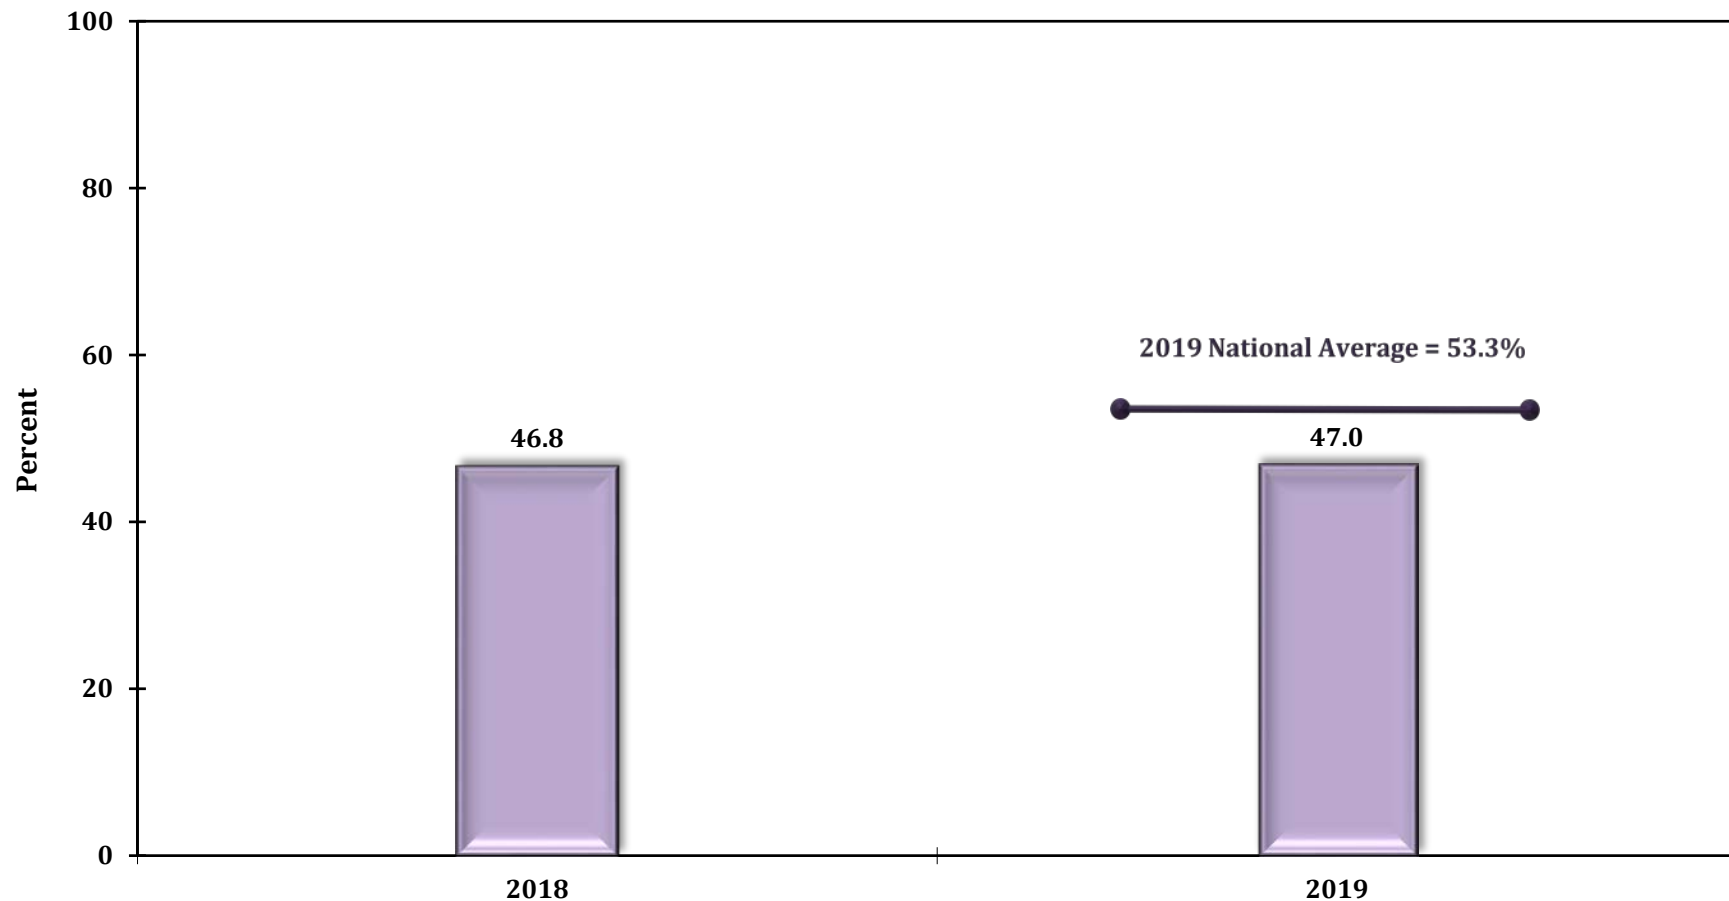

IMMUNIZATIONS: INFLUENZA 18+

IMMUNIZATIONS: ADULT

Measure: Adult immunization rates amongst adult patients aged 19 years and older.

Importance: *Adult vaccines provide protection from diseases that adults are susceptible to and which can cause significant illness or even death. Getting recommended vaccinations at appropriate ages can protect adults from Tetanus, Shingles, and pneumonia.*

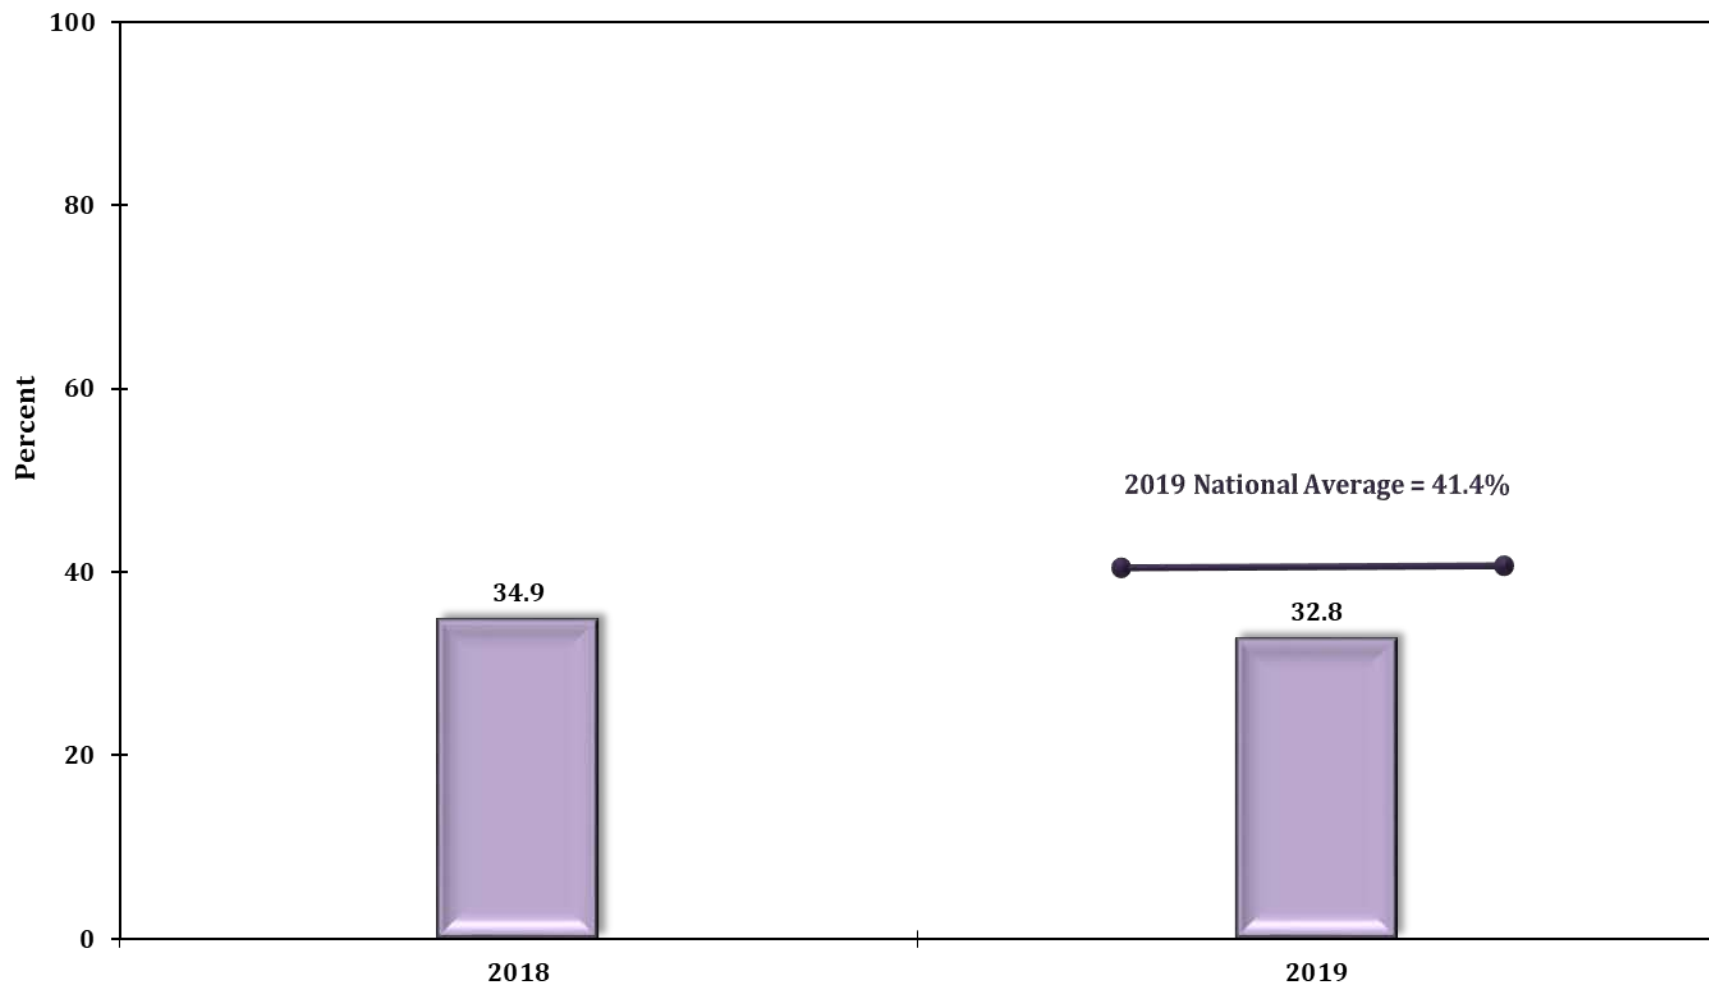

IMMUNIZATIONS: ADULT

IMMUNIZATIONS: CHILDHOOD (19 – 35 months)

Measure: Combined (4:3:1:3*:3:1:4) immunization rates for AI/AN patients aged 19-35 months.

Importance: *Immunizations significantly improve the health of children, and stop the spread of disease within communities. The Healthy People 2020 goal is 80% coverage for the combined 4:3:1:3:3:1:4 series, which includes 4 doses of DTaP (Diphtheria/Tetanus/Pertussis-Whooping Cough), 3 doses of IPV (Polio), 1 dose of MMR (Measles/Mumps/Rubella), 3 or 4 doses of Hep B (Hepatitis) depending on brand, 3 doses of Hib (Haemophilis Influenzae- a cause of meningitis), one dose of Varicella (Chicken Pox), and 4 doses of PCV (Pneumococcal Conjugate).*

IMMUNIZATIONS: CHILDHOOD (19 – 35 months)

CANCER SCREENING: CERVICAL (PAP SMEAR)

Measure: Percentage of female patients age 24-64 who have had a Pap screen within the past three years, or women age 30-64 with a Pap Screen and an HPV DNA in the past five years.

Importance: *More American Indian women report having never had a Pap screen than any other racial or ethnic group. Regular screening with a Pap screen lowers the risk of developing cervical cancer by detecting pre-cancerous changes. If cervical cancer is detected early, the likelihood of survival is almost 100 percent with appropriate treatment and follow up.*

CANCER SCREENING: CERVICAL (PAP SMEAR)

CANCER SCREENING: BREAST (MAMMOGRAPHY)

Measure: Percentage of eligible women who have had mammography screening within the previous two years.

Importance: *Screening women between the ages of 50 and 69 every other year has been shown to decrease the risk of death from breast cancer. Breast cancer is the second leading cause of cancer death among U.S. women (lung cancer is first). Although there has been overall improvement in breast cancer death rates since 1990, AI/AN women have not shared these gains. AI/AN women diagnosed with breast cancer have lower likelihood of surviving for five years compared to almost all other groups, mainly because their cancers are less likely to be found at an early stage, where they can be treated effectively.*

*Measure logic change in FY 2019

CANCER SCREENING: BREAST (MAMMOGRAPHY)

CANCER SCREENING: COLORECTAL

Measure: Percentage of eligible patients who have had appropriate colorectal cancer screening.

Importance: *Colorectal cancer is more common among Alaska Native and Northern Plains American Indians than among other groups, and the risk of death is higher than the national average. Screening improves the chance that colorectal cancer will be detected at an earlier stage, when it is more likely to be cured. Patients diagnosed at an early stage are 90% likely to survive for five years, but patients diagnosed at later stages have lower survival rates. The risk of colorectal cancer increases with age; 9 of 10 cases of colorectal cancer are found in individuals aged 50 and older.*

CANCER SCREENING: COLORECTAL

TOBACCO CESSATION

Measure: Percentage of tobacco-using patients that receive tobacco cessation intervention or quit.

Importance: *Cigarette smoking is the leading preventable cause of death in the United States, resulting in an estimated 443,000 premature deaths each year. American Indians and Alaska Natives have the highest prevalence of current cigarette smoking (30%) of any other racial/ethnic group in the U.S. Tobacco users who quit enjoy longer and healthier lives, on average, than those who do not. Even long-time smokers can significantly reduce their risk of heart disease and other complications by quitting.*

TOBACCO CESSATION

UNIVERSAL ALCOHOL SCREENING

Measure: Percentage of patients ages 9 to 75 who are screened for alcohol use

Importance: *Risky alcohol use occurs in 29% of the general U.S. population which can contribute to many negative health consequences, including motor vehicle crashes, fetal alcohol syndrome, and longer-term health consequences such as high blood pressure, gastritis, liver disease, and some cancers. Research has shown that alcohol screening is effective at reducing risky drinking. The U.S. Preventive Services Task Force recommends screening all adolescents and adults for risky alcohol use in the primary health care setting.*

UNIVERSAL ALCOHOL SCREENING

SCREENING, BRIEF INTERVENTION, AND REFERRAL TO TREATMENT

Measure: Percentage of patients provided a Brief Negotiated Interview (BNI) or Brief Intervention (BI) in ambulatory care within 7 days of a positive screen for risky/harmful alcohol use

Importance: *At least 38 million adults in the U.S. drink too much alcohol and only 1 in 6 speak with their primary care provider about their drinking. Studies have show that providing alcohol screening and brief counseling can reduce the amount of alcohol consumed on an occasion by 25% in those who drink too much.*

SCREENING, BRIEF INTERVENTION, AND REFERRAL TO TREATMENT

DOMESTIC VIOLENCE/INTIMATE PARTNER VIOLENCE SCREENING

Measure: Percentage of women ages 14 to 46 who are screened for domestic violence at health care facilities.

Importance: *It is estimated that one in three American Indian/Alaska Native women have experienced domestic or intimate partner violence during their lives. Surveys at Indian Health hospitals have found even higher rates. Women who experience domestic violence are more often victims of nonconsensual sex and have higher rates of smoking, chronic pain syndromes, depression, anxiety, substance abuse, and Post-Traumatic Stress Disorder. Screening and offering help for victims of domestic violence will help to reduce this problem in Indian country.*

DOMESTIC VIOLENCE/INTIMATE PARTNER VIOLENCE SCREENING

DEPRESSION SCREENING 12-17 YEARS

Measure: Percentage of adolescents ages 12 to 17 years who receive depression screening.

Importance: *In national surveys, approximately 8% of adolescents reported having major depression in the past year. Major depression in adolescents can have negative impacts on their school and work performance. The U.S. Preventive Services Task Force recommends annual screening for depression in adolescents ages 12 to 18 years of age. Research has shown that depression screening in primary care settings can accurately identify major depressive disorder in adolescents.*

DEPRESSION SCREENING 12-17 YEARS

DEPRESSION SCREENING 18+

Measure: Percentage of adults ages 18 and older who receive depression screening.

Importance: *Almost one in six U.S. adults experience major depression during their lifetime. Depression and anxiety disorders may affect heart rhythms, increase blood pressure, and lead to elevated blood sugar and cholesterol levels. Depression also frequently increases the risk of suicidal behavior. The risk of suicide attempts among patients with untreated major depressive disorder is one in five. Screening for depression is the first step toward identifying patients who need intervention, treatment, and follow up.*

DEPRESSION SCREENING 18+

CVD STATIN THERAPY

Measure: Percentage of CVD patients and patients at high risk of CVD who receive statin therapy

Importance: *Cardiovascular disease (CVD) is the leading cause of death for American Indian and Alaska Native people over age 45. Unlike other racial and ethnic groups, American Indians appear to have a growing rate of cardiovascular disease, likely because of the high rate of diabetes among American Indians. After a review of several large studies, the U.S. Preventive Services Task Force found that patients who are at high risk for CVD and taking statins had a decreased risk of cardiovascular disease-related morbidity and mortality.*

CVD STATIN THERAPY

CONTROLLING HIGH BLOOD PRESSURE (MILLION HEARTS)

Measure: Percentage of patients with diagnosed hypertension who have achieved blood pressure control (<140/90).

Importance: *Million Hearts (MH) is a national initiative started by the U.S. Department of Health and Human Services in 2011 to prevent 1 million heart attacks and strokes by 2017. Blood Pressure Control is one of the quality measures reported for this initiative, and is the only MH measure reported by IHS. Uncontrolled high blood pressure greatly increases the risk of heart attack, stroke, aneurysm, and heart failure. Studies have shown that keeping blood pressure controlled lowers the risk of heart attack by 20%, lowers the risk of stroke by 35%, and lowers the risk of heart failure by 50%.*

CONTROLLING HIGH BLOOD PRESSURE (MH)

HIV SCREENING EVER

Measure: Percentage of patients who have ever been screened for HIV.

Importance: *The HIV/AIDS epidemic is a significant issue for American Indian and Alaska Native people. American Indians and Alaska Natives represent approximately 1.2% of the U.S. population, yet were ranked 5th in estimated rates of new HIV diagnoses in 2014, higher than whites and Asians. HIV screening enables medical providers to provide appropriate care and treatment to those who screen positive, and education on ways to prevent transmission of the virus.*

HIV SCREENING EVER

CHILDHOOD WEIGHT CONTROL

Measure: Percentage of children ages 2-5 years with a BMI at the 95th percentile or above.

Importance: *Rates of overweight among American Indian and Alaska Native children exceed the national averages. Overweight among children is defined as a Body Mass Index (BMI) at the 95th percentile or above. Children who are overweight often have elevated blood pressure, cholesterol, and insulin levels. They are at greater risk of developing type 2 diabetes. They are also at risk for shame, self-blame, and low self-esteem, all of which may affect how well they perform in school, and get along with their peers. A lower rate is the goal for this measure.*

CHILDHOOD WEIGHT CONTROL

BREASTFEEDING RATES

Measure: Percentage of patients who are exclusively or mostly breastfed at 2 months of age.

Importance: *Breastfeeding has been shown to have positive outcomes for both the mother and child. Breastfed children show lower incidences of obesity, Type 1 and Type 2 Diabetes, respiratory tract infections and ear infections. Studies have shown that mothers who breastfeed for at least three months may lose more weight than non-breastfeeding mothers, have a reduced risk of breast and ovarian cancer, and may have a reduced risk of osteoporosis. Breastfeeding can also help new mothers bond with their infants.*

BREASTFEEDING RATES
