Version Control

Version	Date	Notes
1.0	February 2008	Initial version.
2.0	November 2009	Added: REVENUE table to ENCTR section Removed: ERROR schema tables PROMOTER tables
2.1	January 2011	Begin Annual Review/Update
3.0	May 2011	Final
4.0	May 2012	Annual Review/Update (Final)

Introduction

The National Data Warehouse (NDW) environment utilizes tables, views, sequences, and temporary tables to maintain data received from remote sites and areas in an orderly fashion for use in marts, queries, special requests, and data mining.

The ability of DB2 to reference tables in another database is called Federation. The association is accomplished through the use of nicknames. A **nickname** is a local name for a remote table and can support partial or complete tables, with or without security controls. Nicknames may be in any schema and completely mimic physical tables. Data changes in remote tables are reflected immediately in local nicknames, but structure changes are not.

Note: T/V/N = T(able), V(iew), N(ickname)
