

RESOURCE AND PATIENT MANAGEMENT SYSTEM

Patient Registration (AG)

Technical Manual

Version 7.1
August 2005

Office of Information Technology
Albuquerque, New Mexico

PREFACE

The Indian Health Service (IHS) Patient Registration application is the basis of most RPMS software, providing for the entry of new patients and editing of those already registered at a facility. Patient registration is very important to third party billing of patient care. Appropriate caution and checking should be employed to ensure that accurate data is maintained by patient registration and, subsequently, transmitted to the National Patient Information Resource System (NPIRS).

This software application will work in conjunction with the existing Resource and Patient Management (RPMS) applications. The distribution of the package will be IHS-wide.

SECURITY

This application is subject to all parts of the Patient Privacy Act. Information contained within this system is considered sensitive. Abuse or misuse of the information contained within this system is subject to disciplinary and legal action.

This package does not impose any additional legal requirements on the user, nor does it relieve the use of any legal requirements. Names and social security numbers used in the examples are fictitious.

This package requires access and verify codes to access the system. These can be obtained from your supervisor or site manager. In addition, security keys are assigned with your access codes. They are required to perform certain options in the Patient Registration application. Some options within the application are “locked”, i.e., the user is unable to access the option without the appropriate security key. A list of the security keys new to version 7.0 can be found in section 11.0.

1.0 Introduction

This manual provides IHS site managers with a technical description of the Patient Registration routines, files, menus, cross references, globals, and other necessary information required to effectively manage the system.

All routines, files, options, and keys are namespaced starting with the letters “AG.” The file number range for this package is 9009061 – 9009066.

This application provides for the collection and maintenance of a patient demographic and eligibility file that is used by all other RPMS patient-oriented systems.

This system works in conjunction with the VA Patient File and contains several subsets or categories of information for each patient. It also provides the communications tools to send demographic updates to the centralized IHS patient database at the National Patient Information Resource System (NPIRS) in Albuquerque, New Mexico. The registration system contains insurance policy data to support third party billing. Reports are available to assist staff in reviewing overall data quality.

2.0 Implementation and Maintenance

2.1 General Information

The Patient Registration Module occupies the AG namespace. Options, security locks/keys, templates, routines, and globals are namespaced AG.

2.2 System Requirements

- Kernel (XU) v8.0 Patch 1009 or later
- FileMan (DI) v21 or later
- Patient Registration (AG) v7.0 through patch 5
- AUT v 98.1 through patch 15
- AUPN v 99.1 through Patch 15

8.0 Archiving And Purging

There is no archiving and purging in this package.

9.0 External Relations

9.1 External Calls

The Patient Registration System makes extensive use of the documented entry points into FileMan, the device handler, and TaskMan. The following list indicates the external calls made by the system to other RPMS packages.

Routine Called	Invoked By
D SET^AUPNLKZ	AG0+32, AG0+103, AGADDR+14, AGADDR1+20
D RESET^AUPNLKZ	AG0+34, AG0+105, AGADDR+14, AGADDR1+20
D NAME^AUPNPED	AGEDNAME+116

9.2 Published Entry Points

ENTRY POINT	DESCRIPTION
DFN^AGFACE	Pre-defined patient number
DOG^AG0	From other systems
EN^AGEVLM	main entry point for AGEV ELIGIBILITY VERIFICATION
EN1^AGEVLM	requires DFN to be set to patient
KILL^AG	Clean up variables
L2^AGSEENLY	Created On 9/14/04 for View Patient Record (VPR)
PATNLK^AGEDIT	Entry point for packages that already have patient's name
START^AGFACE	From TaskMan
UID(AG)^AGTXID	Given DFN return unique patient record ID
UPDATE^AGED	Generate extrinsic from general call to update
UPDATE^AGED	Called from PCC to update AGPATCH File
VAR^AGED4A	PEP created for PCC+

10.0 Internal Relations

Users should be given access to the appropriate options and keys, as needed. All of the options in this system stand alone.

11.0 Security Keys

You will need to assign security keys to users based on the type(s) of information they should be able to access.

NOTE: It is highly recommended that the **AGZTXALL** key be removed from all users until such a time as exercise of the option is directed. This key controls the AGX → ALL menu option (Export All Patients for Data Repository), an option that should only be used at the request of a site's area office, the National Programs, or HQ Offices.

12.0 Generating Online Documentation

This section describes a few methods to generate Patient Registration system technical documentation. Online Patient Registration software technical documentation, in addition to that which is located in the help prompts throughout the Patient Registration package, can be generated through the use of several Kernel options. These include, but are not limited to, the following:

- %INDEX
- Menu Management
- Inquire Option
- Print Option File
- VA FileMan
- Data Dictionary Utilities
- List File Attributes

Typing ? at the “Select . . . Option” prompt will provide online technical information.

A single question mark (?) lists all options that can be accessed from the current option.

Two question marks (??) list all options accessible from the current one, showing the formal name and lock for each.

Three question marks (???) display a brief description for each option in a menu.

An option name preceded by a question mark (?OPTION) shows extended help, if available, for that option.

For a more exhaustive option listing and further information about other utilities that supply online technical information, consult the DHCP Kernel Reference manual.

12.1 %INDEX

This option analyzes the structure of a routine to determine in part if the routine adheres to RPMS programming standards. The %INDEX output can include the following components:

- Compiled list of errors and warnings
- Routine listing
- Local variables
- Global variables
- Naked globals
- Label references
- External references

Running %INDEX for a specified set of routines, allows users to discover any deviations from RPMS programming standards that exist in the selected routines and to see how routines interact with one another (i.e., which routines call or are called by other routines).

To run %INDEX for the Patient Registration package, type the AG namespace at the Routine(s)?> prompt.

Note: Debt Collection initialization routines that reside in the UCI in which %INDEX is being run, compiled template routines, and local routines found within the BBMD namespace should be omitted at the Routine(s)?> prompt. To omit routines from selection, preface the namespace with a minus sign (-).

12.2 Inquire Option

This menu management option provides the following information about a specified option:

- Option name
- Menu text
- Option description
- Type of option
- Lock (if any)

In addition, all items on the menu are listed for each menu option. To secure information about patient registration options, specify the AG namespace.

12.3 Print Option File

This utility generates a listing of options from the Option file (#19). Users can choose to print all of the entries in this file or specify a single option or range of options. For a list of Patient Registration options, refer to the Exported Options section of this manual.

12.4 List File Attributes

This VA FileMan option allows users to generate documentation pertaining to files and file structure. Using the standard format of this option yields the following data dictionary information for a specified file:

- File name and description
- Identifiers
- Cross-references
- Files pointed to by the file specified
- Files that point to the file specified
- Input, print, and sort templates

In addition, the following applicable data is supplied for each field in the file:

- Field name, number, title, and description
- Global location
- Help prompt
- Cross-references
- Input transform
- Date last edited
- Notes

Using the Global Map format of this option generates an output that lists the following information:

- All cross-references for the file selected
- Global location of each field in the file
- Input, print, and sort templates

For a comprehensive listing of Patient Registration package files, please refer to the Files section of this manual.

13.0 SAC Exemptions

There are no exemptions to the SAC standards for this version.

14.0 Auditing

If the Patient Registration Supervisor requests to audit fields, Site Managers should refer to the VA FileMan v22 User's Manual (PDF, 3.8MB) Part III Chapter 11, on the RPMS Documents Web site: <http://www.ihs.gov/Cio/RPMS/index.cfm>.

The ITSC strongly recommends Site Managers carefully weigh the benefits and implications of auditing. The VA FileMan Manual mentions the most important implications in relation to database growth, system performance and monitoring of audit file size.

15.0 Glossary

Archiving	The storing of historical or little-used data off-line (often on tape).
ASUFAC number	Area Service Unit Facility; A unique identifier for each facility within IHS. A six-digit number comprised of 2 digits for Area, 2 digits for Service Unit, and 2 digits for Facility.
Banner	A line of text with a user's name and domain.
Browser	An interactive application that displays ASCII text on a terminal that supports a scroll region. The text can be in the form of a word-processing field or sequential local or global array. The user is allowed to navigate freely within the document.
Callable Entry Points	Places in a routine that can be called from an application program.
Cross-reference	An indexing method whereby files can include pre-sorted lists of entries as part of the stored database. Cross-references (x-refs) facilitate look-up and reporting.
Default Facility	A user selects a facility identification to work with patients registered to that facility.
Entry Point	Entry point within a routine that is referenced by a "DO" or "GOTO" command from a routine internal to a package.
File	A set of related records or entries treated as a single unit.
FileMan	The database management system for RPMS.
Global	In MUMPS, global refers to a variable stored on disk (global variable) or the array to which the global variable may belong (global array).
Health Record Number (HRN)	Each facility assigns a unique number within that facility to each patient. Each HRN with its facility identification 'ASUFAC' make a unique identifier within all of IHS.
INDEX (%INDEX)	A Kernel utility used to verify routines and other MUMPS code associated with a package. Checking is done according to current ANSI MUMPS standards and RPMS programming standards. This tool can be invoked through an option or from direct mode (>D ^%INDEX).

Init	Initialization of an application package. The initialization step in the installation process builds files from a set of routines (the init routines). Init is a shortened form of initialization.
Internal Entry Number (IEN)	The number used to identify an entry within a file. Every record has a unique internal entry number.
IRM	Information Resource Management. The IHS personnel responsible for information systems management and security.
Kernel	The set of MUMPS software utilities that function as an intermediary between the host operating system and application packages, such as Laboratory and Pharmacy. The Kernel provides a standard and consistent user and programmer interface between application packages and the underlying MUMPS implementation. These utilities provide the foundation for RPMS.
Menu	A list of choices for computing activity. A menu is a type of option designed to identify a series of items (other options) for presentation to the user for selection. When displayed, menu-type options are preceded by the word "Select" and followed by the word "option" as in Select Menu Management option: (the menu's select prompt).
Namespace	A unique set of 2 to 4 alpha characters that are assigned by the database administrator to a software application.
Official Registering Facility	A facility so designated that when HRNs are added/modified, those changes are sent to the central database. A Service Unit may have several satellites for which it is registering patients.
Option	An entry in the Option file. As an item on a menu, an option provides an opportunity for users to select it, thereby invoking the associated computing activity. Options may also be scheduled to run in the background, non-interactively, by TaskMan.
Patient Care Component (PCC)	The central repository for data in the Resource and Patient Management System (RPMS).
Queuing	Requesting that a job be processed at a later time rather than within the current session.
Routine	A program or sequence of instructions called by a program that may have some general or frequent use. MUMPS routines are groups of program lines that are saved, loaded, and called as a single unit via a specific name.

UCI	User Class Identification: a computing area.
Up-Hat (^)	A circumflex, also know as a “hat” or “caret,” that is used as a piece delimiter in a global. The up-hat is denoted as “^” and is typed by pressing Shift+6 on the keyboard.
Utility	A callable routine line tag or function. A universal routine usable by anyone.
Variable	A character or group of characters that refers to a value. MUMPS recognizes 3 types of variables: local variables, global variables, and special variables. Local variables exist in a partition of the main memory and disappear at sign-off. A global variable is stored on disk, potentially available to any user. Global variables usually exist as parts of global arrays.

16.0 Appendix A: Eligibility Upload Technical Specifications

16.1 Functionality Notes

- The Upload function doesn't run a date check on the file name, so it is possible to run the same file twice. (A run date check is being considered as a possibility for future versions.) While running the same file multiple times won't significantly hurt the system, it may overwrite eligibility changes that were manually-entered after the first run of the file.
- Medicaid eligibility formats have been created for a couple of states (MI, OK, NM), but ITSC does not have any intention of creating a format for each state. The states that ITSC has created a format for were for Areas that did not have the resources available to create one locally. If you don't want users to see these formats, you can just hide the option that does the upload.
- We are only providing the functionality to process Medicaid eligibility data; it is the Area's responsibility to get the actual data directly from the state.

16.2 What Didn't Change

- The system still looks up the patient by SSN.
- The data upload only occurs when the data in the found entry doesn't match the data in the file.
- The Medicare Upload process did not change, including the auditing function.
- The Medicare matching criteria has not changed; it has to match at least on SSN but there are other criteria that you can edit through the EMC menu option (see the user's guide (ag__070u.pdf) for more on the EMC option).

16.3 Fields Edited in the Upload

The fields listed below may or may not be updated by the Medicare/ Medicaid upload processes.

16.3.1 Medicare

- Insurer (9000003,.02)
- Medicare Number (9000003,.03)
- Suffix (9000003,.04)
- Medicare Name (9000003,2101)
- Medicare DOB (9000003,2102)

- Eligibility dates (9000003.11,.01 & .02)
- Coverage type (9000004.11,.03)

16.3.2 Medicaid

- Insurer (9000004,.02)
- Medicaid Number (9000004,.03)
- Medicaid State (9000004,.04)
- Sex of Insured (9000004,.07)
- Date of last update (9000004,.08)
- Medicaid Name (9000004,2101)
- Medicaid DOB (9000004,2102)
- Eligibility dates (9000004.11,.01 & .02)
- Coverage type (9000004.11,.03)
