

Hi. My name is David Hogner. I'm an environmental health officer with the United States Public Health Service. The Indian Health Service Division of Sanitation Facilities Construction may have installed new water or sewer facilities at your home.

In order for these sanitation facilities to provide many years of uninterrupted service to you and your family, there are some preventive measures that you can take.

I'd like to go over some tips on how you can keep your systems operating effectively.

We'll also review basic troubleshooting techniques and important safety measures.

Let's begin.

First we'll take a look at the source of fresh water to your home.

You'll either have a private water well on your property, or you may be connected to a community water system. Scroll through the onscreen menu to the picture that represents the type of system at your home, and press play.
