Division of Sanitation Facilities Construction**

**In accordance with  
The Indian Health Care Improvement Act  
P.L. 94-437, as amended  
25 U.S.C. § 1601 *et seq.***

## **Mission**

The mission of the Indian Health Service (IHS) is to raise the physical, mental, social, and spiritual health of American Indians and Alaska Natives to the highest level. To carry out this mission, the IHS provides comprehensive primary health care and disease prevention services. The Sanitation Facilities Construction (SFC) Program is the environmental engineering component of the IHS health delivery system. To support the IHS mission, the SFC Program provides technical and financial assistance to American Indian tribes and Alaska Native villages for the cooperative development and construction of safe drinking water supply, sewage, and solid waste disposal facilities, and related support facilities.

## **I. Purpose**

The purpose of this report is to satisfy the reporting requirements for the Sanitation Facilities Construction (SFC) Program under section 302 of the Indian Health Care Improvement Act (IHCA), codified as amended at 25 U.S.C. § 1632(g), excerpted below:

### ***(g) Annual report; sanitation deficiency levels***

*(1) The Secretary shall submit to the President, for inclusion in each report required to be transmitted to the Congress under section 1671 of this title, a report which sets forth—*

- (A) the current Indian sanitation facility priority system of the Service;*
- (B) the methodology for determining sanitation deficiencies;*
- (C) the level of sanitation deficiency for each sanitation facilities project of each Indian tribe or community;*
- (D) the amount of funds necessary to raise all Indian tribes and communities to a level I sanitation deficiency; and*
- (E) the amount of funds necessary to raise all Indian tribes and communities to zero sanitation deficiency.*

The information in this report to Congress is used by the Indian Health Service (IHS) to establish budgetary funding requests and to allocate funding resources received. Additionally, the United States (U.S.) Environmental Protection Agency, the U.S. Department of Agriculture Rural Development, and the U.S. Department of the Interior's Bureau of Reclamation utilize the information contained in this report to aid in the implementation of their programs that support tribal water, sewer, and solid waste infrastructure.

## **II. Background**

The Indian Sanitation Facilities Act, Public Law (P.L.) 86-121, codified at 42 U.S.C. § 2004a, provides the SFC Program with the authority to deliver essential water supply, sewage disposal, and solid waste disposal facilities for American Indian and Alaska Native (AI/AN) homes and communities. The IHS, through its SFC Program, is the lead federal agency for the provision of these facilities and services. Sanitation facilities are provided at the request of federally recognized tribes, bands, villages, and/or groups for homes owned and occupied by AI/AN individuals who are eligible for assistance.

Water, sewage, and solid waste sanitation deficiencies included in this report are identified solely for eligible Indian tribes and communities. Deficiencies for commercial and industrial facilities and non-Indian homes cannot be addressed by the IHS under P.L. 86-121 and are not included in this report. In addition, municipalities and communities organized under the laws of a state are not typically considered Indian communities, even though there may be eligible AI/AN people living there. The provision of community-type sanitation facilities for such non-Indian communities is generally considered to be the responsibility of the non-Indian municipality or community, and the needs are not identified by the IHS as sanitation deficiencies unless an agreement to contribute funds to cover the prorated cost of the facilities serving the non-Indian beneficiaries has been established. Under the statute, projects that include service to non-Indians must be primarily for the benefit of Indians.

### III. Key Definitions

The following are key definitions used by the IHS when identifying and reporting on sanitation deficiencies:

**Sanitation Deficiency** is defined as a need arising from existing water, sewer, or solid waste infrastructure (or the lack thereof) that creates or may result in exposure to environmental conditions that can negatively impact public health. Agency staff work closely with tribal officials to identify sanitation deficiencies and develop projects to address them. For reporting purposes, projects are quantified in terms of the number of projects or project phases, the estimated costs, and the number of homes requiring different types of assistance (water supply, sewage disposal, solid waste disposal, and operations and maintenance (O&M) equipment and training).

**Adequate or Adequacy** implies that the sanitation facilities serving an eligible AI/AN home comply with all applicable federal, state, and local health and environmental laws and regulations, and good public health practices. Adequacy also implies that eligible AI/AN homes have piped indoor water and sewer facilities.

**Feasible or Feasibility** implies the economic practicality of constructing the project. Projects that are determined to be economically feasible are used to allocate IHS funding resources. Infeasible projects are reported as part of the total cost, but are not used to allocate IHS funding resources. Funds contributed from other entities can still be used to fund these types of projects.

**Health Impact** represents the potential for occurrence of a disease or other adverse human health effect directly attributable to the failure or lack of water, sewer, or solid waste facilities. A health hazard is a water, sewer, or solid waste condition that could adversely impact human health. Health impacts and health hazards can vary for different deficiency levels.

**Deficiency Level** is a numeric categorization of the magnitude of the sanitation deficiency of the facilities in question. The numeric categories are provided under section 302 of the IHCA, codified as amended at 25 U.S.C. § 1632(g)(4), as follows:

- Level I: An Indian tribe or community with a sanitation system which complies with all applicable water supply and pollution control laws, and in which the deficiencies relate to routine replacement, repair, or maintenance needs;
- Level II: An Indian tribe or community with a sanitation system which complies with all applicable water supply and pollution control laws, and in which the deficiencies relate to capital improvements that are necessary to improve the facilities in order to meet the needs of such tribe or community for domestic sanitation facilities;
- Level III: An Indian tribe or community with a sanitation system which has an inadequate or partial water supply and a sewage disposal facility that does not comply with applicable water supply and pollution control laws, or that has no solid waste disposal facility;
- Level IV: An Indian tribe or community with a sanitation system which lacks either a safe water supply system or a sewage disposal system; and

Level V: An Indian tribe or community that lacks a safe water supply and a sewage disposal system.

#### **IV. Methodology**

Agency field-level staff work collaboratively with tribes to identify sanitation deficiencies and plan and develop projects to address those deficiencies. Agency field-level staff are ideally positioned to complete this work because of their technical training and the relationships they build with the tribal communities they serve. Methods for identifying sanitation deficiencies include the following:

- Field visits by IHS engineers, environmental health officers, community health representatives, nurses, or tribal health staff;
- Sanitary surveys;
- Community environmental health profiles;
- Tribal master plans for development;
- Feasibility studies; and
- Geographic Information System (GIS) databases/maps/imagery.

Projects are developed and planned to correct the identified deficiencies. Each IHS Area incorporates tribal and community preferences, as appropriate, when identifying deficiencies and developing projects. Project planning includes the following activities:

1. Identifying AI/AN homes with sanitation deficiencies;
2. Considering applicable laws and regulations (e.g., Safe Drinking Water Act, Clean Water Act, Resource Conservation and Recovery Act);
3. Selecting the category and type of facilities needed (water, sewer, solid waste disposal, O&M development) and evaluating alternatives;
4. Identifying and mitigating risks to project implementation, such as those associated with technical design, rights-of-way, and environmental concerns;
5. Reviewing O&M considerations; and
6. Developing an engineering cost estimate (within 10 percent for high-priority projects and within 25 percent for other projects).

Agency staff, in collaboration with tribes, establish a project's deficiency level (DL) by assessing the lack of, or condition of, existing sanitation facilities serving AI/AN homes. Projects may address a variety of sanitation deficiencies within a particular tribal community. Each proposed project or project phase will not necessarily bring all of the facilities for a tribe or community to Level I deficiency or better. However, the combination of all projects for a particular community will bring that community to Level I or better.

Developed projects are entered into the IHS Sanitation Deficiency System (SDS), a database shared by all 12 IHS Areas, where each IHS Area ranks and orders the proposed projects according to a shared methodology. Under this methodology, points are assigned for each of the following categories:

1. **Health Impact** (0 to 30 points) - Represents the potential for occurrence of a disease or other adverse human health effect directly attributable to the failure of (or lack of) water, sewer, or solid waste disposal facilities.
2. **Project Deficiency Level** (0 to 25 points) - Reflects the deficiency level of facilities to be replaced or modified by the proposed project, as defined in section 302 of the IHCA, codified as amended at 25 U.S.C. § 1632(g)(4).
3. **Adequate Previous Service** (0 to 4 points) - Allows for prioritizing projects that serve tribal communities that have not previously been provided adequate water and sewage facilities through federal sources (optional category per the IHS Area guidelines).
4. **Capital Cost** (-9 to 9 points) - Reflects the relative cost per home served by the project compared to similar projects in the IHS Area. Projects with a lower cost per home served receive a higher priority.
5. **Local Tribal Priority** (0 to 16 points) - Reflects a tribe's documented priorities for their preferred projects.
6. **O&M Capability** (0 to 16 points) - Reflects the probability that adequate operation and maintenance of the facilities that will be provided through the project.
7. **Contributions** (0 to 8 points) - Allows for prioritization of projects that leverage funding contributions from non-IHS sources (optional category per the IHS Area guidelines).
8. **Other Considerations** (-15 to 0 points) - Allows for adjustment of the project's overall score to compensate for unusual circumstances, such as project sequencing needs and the status of project planning (documentation by the IHS Area is required).

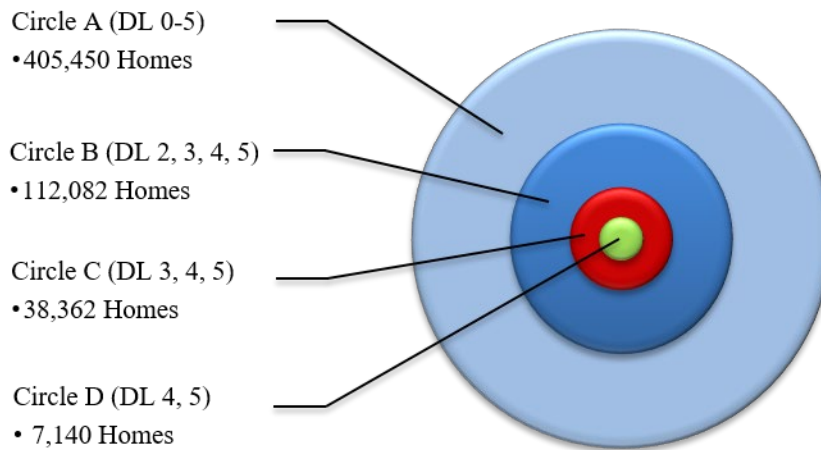

Each IHS Area considers a range of factors in establishing the point values assigned for each category. National guidelines have been developed to help ensure consistent project scoring. Included in these guidelines are detailed instructions on assigning deficiency levels. The SDS was developed with the intention of identifying and reporting on the projects required to raise all AI/AN homes and communities to a Level I sanitation deficiency (adequate water supply, sanitary sewage, and solid waste disposal facilities) or better, as required by the IHCA.

On an annual basis, each IHS Area updates the project data that describe the IHS Area's identified sanitation facility needs, prioritizing the resulting project list, and submitting that data to IHS headquarters for review and compilation. That data forms the basis for this report.

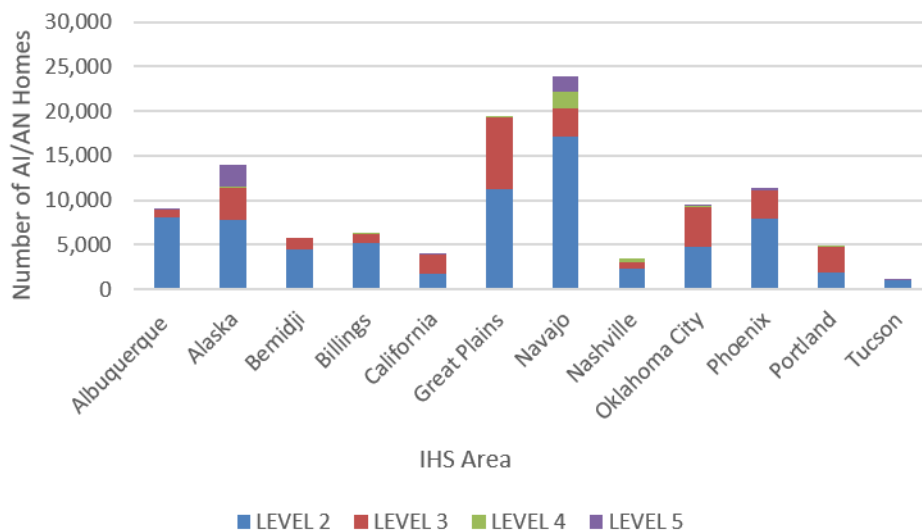

## V. Results

The results of the SDS methodology described in the previous section are summarized below. As depicted by the scaled graphic characterization in Figure 1, at the end of fiscal year (FY) 2020, there were 405,450 AI/AN homes included in the IHS Home Inventory Tracking System database, represented by *Circle A*. The area of *Circle B* is a representation of the 112,082 AI/AN homes identified as needing some form of sanitation facility improvement (classified as DL 2, 3, 4, or 5). The area of *Circle C* represents the 38,362 AI/AN homes without access to adequate sanitation facilities (DL 3, 4, or 5). The area of *Circle D* represents the 7,140 AI/AN homes without access to a safe water supply system and/or a sewage disposal system (DL 4 and 5). Figure 2 breaks down these same home counts by the IHS Area and DL.

**Figure 1. Universe of AI/AN Homes Requiring Sanitation Facility Improvements**

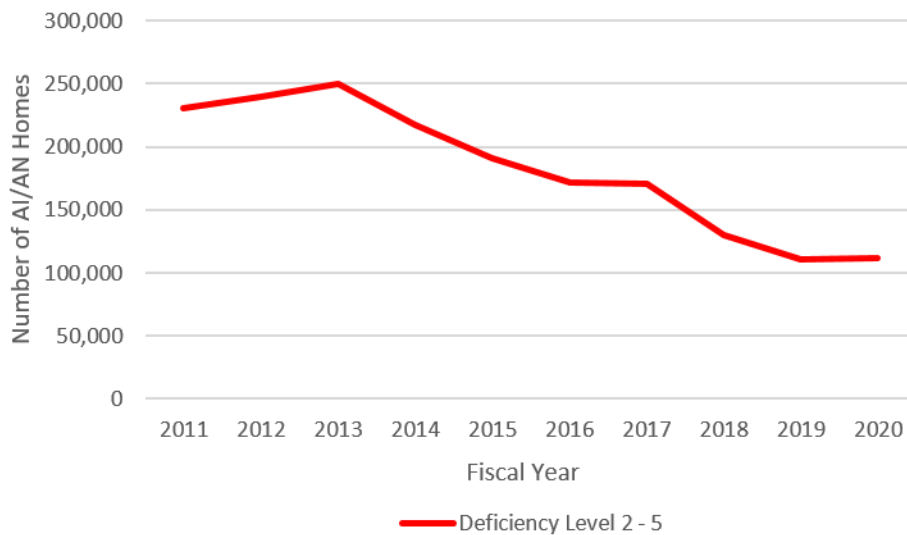

**Figure 2. Number of AI/AN Homes Requiring Sanitation Facility Improvements by IHS Area**

The number of eligible AI/AN homes with a sanitation DL 2 to 5 has decreased 51 percent since FY 2011. This decrease is likely attributed to the improved sanitation needs identification and justification by SFC program staff, along with project funding to address sanitation deficiencies at eligible AI/AN homes. In FY 2014, a program-wide focus was made to ensure projects identifying sanitation facility needs included in the SDS were properly documented and scored according to program guidelines. This effort continued through FY 2020. Figure 3 shows the trends in total number of eligible AI/AN homes with a DL 2 to 5 over the past 10 years.

**Figure 3. Total Eligible AI/AN Homes with Sanitation Deficiency Level 2 to 5**

The SFC Program has compiled two estimates of the costs to address sanitation deficiencies at these homes:

- 1) The Total Cost Estimate includes all projects listed in the SDS without regard to economic feasibility; and
- 2) The Feasible Project Cost Estimate, a subset of the Total Cost Estimate, which includes only those projects considered economically feasible.

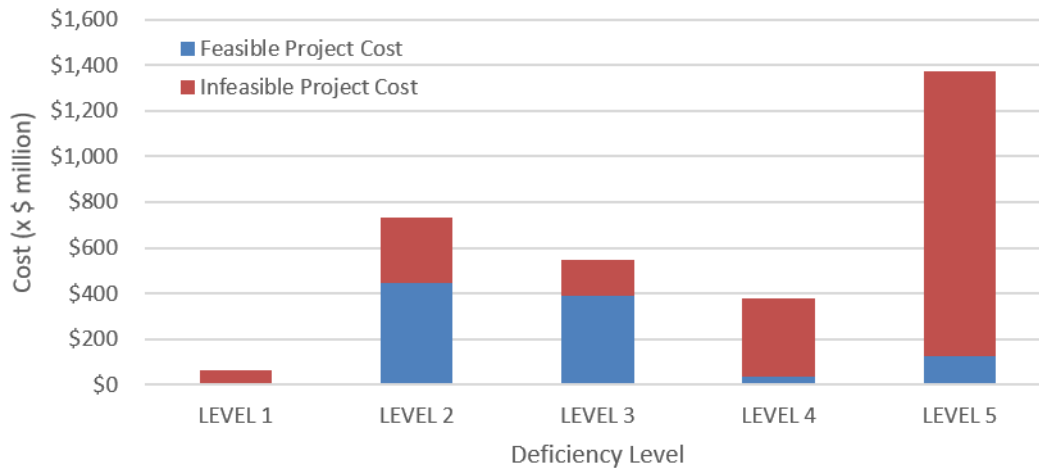

The Appendix to this report contains the priority order listing by IHS Area of all projects in the IHS database. Projects that are not economically feasible have been indicated as such in this listing.

Capital costs, O&M costs, and O&M capability are evaluated as part of project planning and the priority scoring process. The feasible project cost estimate forms the basis for the IHS Funding Plan, which is used for developing budget requests and for allocating appropriated funds to the 12 IHS Areas.

'All projects are re-evaluated annually to determine whether the costs and priority scoring factors have changed. In FY 2020, the total database of agency-identified sanitation deficiencies included 1,580 projects. Of this total, 1,036 projects were feasible and 544 projects were infeasible with a total cost of \$3.09 billion. This was an increase of \$512 million over the FY 2019 level and a result of final SDS guidance completed in FY 2019.<sup>1</sup> This guidance allows the identification of sanitation needs that have only been preliminarily assessed. Prior to FY 2019, identified sanitation needs were required to have been more fully assessed, which included the completion of some planning and design activities.

Below displays the project cost information summarized by deficiency level (Figure 4) and type of service (Figure 5).

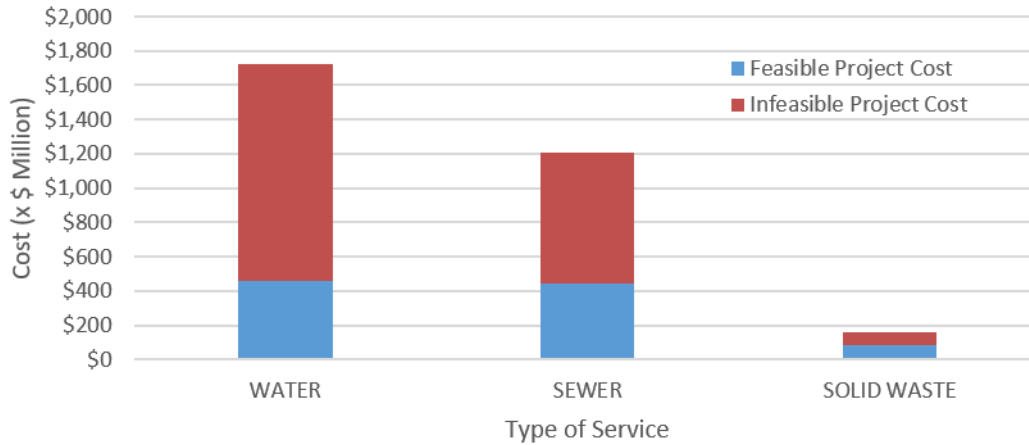

**Figure 4. Estimated Cost to Address Sanitation Deficiencies by Deficiency Level**

Note: Total Cost = (Feasible Project Cost) + (Infeasible Project Cost)

<sup>1</sup> Indian Health Service. Sanitation Deficiency System (SDS) A Guide for Reporting Sanitation Deficiencies for American Indian and Alaska Native Homes and Communities. September 2019 available at [https://www.ihs.gov/sites/dsfc/themes/responsive2017/display\\_objects/documents/Final\\_SDS\\_Guide\\_v2.pdf](https://www.ihs.gov/sites/dsfc/themes/responsive2017/display_objects/documents/Final_SDS_Guide_v2.pdf).

**Figure 5. Estimated Cost to Address Sanitation Deficiencies by Type of Service**

Note: Total Cost = (Feasible Project Cost) + (Infeasible Project Cost)

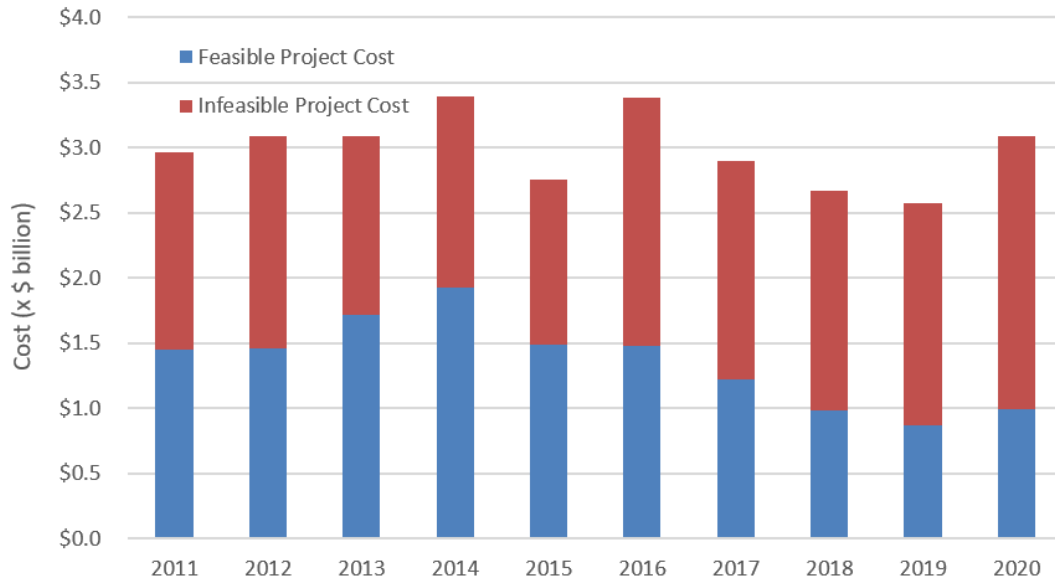

At the end of FY 2020, the total cost to raise all Indian tribes and communities to the DL 1 classification was estimated at \$3.03 billion.

The IHCIA requires the IHS to report total cost to raise all Indian tribes and communities from a DL 1 to zero sanitation deficiency. Zero sanitation deficiencies, as defined in the IHCIA, is an Indian tribe or community sanitation system that complies with all water supply and pollution control laws with no routine replacement, repair, or maintenance needs. At the end of FY 2020, the IHS identified \$62 million in project costs for this purpose. However, given the limited SFC program staff resources available, this need has not been fully captured in the IHS data collection process and this estimate is likely understated. The SFC Program is currently undertaking an effort to estimate the cost of operation and maintenance needs through a less resource-intensive statistical model that includes estimates of staff funding needs to maintain compliance with water supply and pollution control laws.

Costs for providing piped water and sewer facilities to AI/AN homes located in remote locations with harsh climates and unusual subsurface conditions are extremely high. The SFC Program recognizes that piped water and sewer projects for these homes are not currently economically feasible, and while these piped water and sewer projects are included in the total cost estimate, they are not included in the feasible project cost estimate. At the end of FY 2020, the feasible project cost estimate was \$991 million.

A summary of costs for FY 2011 – FY 2020 is provided in Figure 6 below:

**Figure 6: 10-Year SDS Project Cost Estimates - FY 2011 through FY 2020**

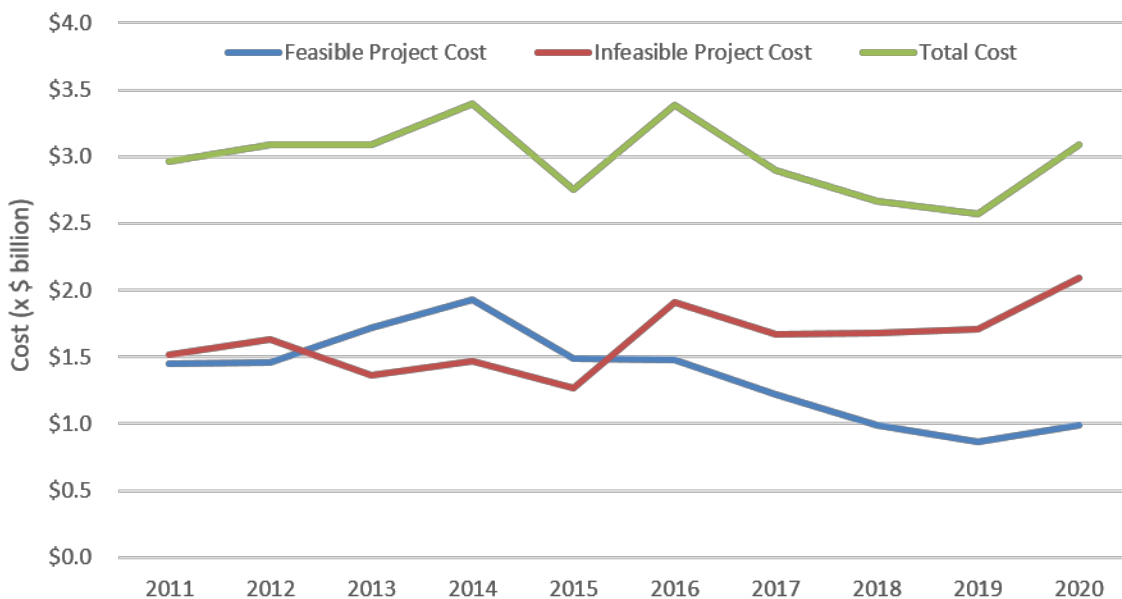

Note: Total Cost = (Feasible Project Cost) + (Infeasible Project Cost)

The IHS supports the planning, design, and construction of projects that are infeasible, typically as a result of funding contributions from other federal agencies and/or tribal sources. The SFC Program has provided alternatives and will continue to work with AI/AN tribes and communities to identify other less costly types of sanitation facilities (e.g., offsite watering points and sewer haul systems). The SFC Program will also continue to track and estimate project costs to serve these AI/AN homes with piped water and sewer systems.

The costs to address all sanitation deficiencies during the 10-year period from FY 2011 to FY 2020 have been in the range of \$2.5 to \$3.5 billion per year as shown in Figure 7. The feasible project need has trended lower since FY 2014. Infeasible need has been trending upward since FY 2015 and accounted for nearly 70 percent of the total need in FY 2020.

Trends of total feasible project and infeasible project need for FY 2011 – FY 2020 are provided in Figure 7 below:

**Figure 7: 10-Year SDS Project Cost Estimate Trends - FY 2011 through FY 2020**

Note: Total Cost = (Feasible Project Cost) + (Infeasible Project)

These trends indicate the cost per home of the remaining sanitation facilities projects are increasing. This is primarily due to the high cost to serve AI/AN homes in remote locations with harsh climates and unusual subsurface conditions. Other cost variations reflect the effects of inflation, changes resulting from factors such as new regulations, changes in the number of eligible AI/AN homes, new tribes gaining federal recognition, and the deterioration of previously installed facilities. Indian Health Service program staff will continue to work with their tribal counterparts to improve the reporting of sanitation deficiencies, which may contribute to fluctuations in the total cost estimate in future years.
